The organization of Brazilian education QAE is too complex to describe in full. It would require an account of the organization of education at the federal level, in 26 states and a federal district, and in around 5500 municipalities. These different entities can have their own QAE measures (Rambla, 2012). Cooperation between these entities varies and can be very limited (Azevedo and Santos, 2012). Brazil has had an influential education community, which developed QAE measures during the 20th century. This was facilitated by the federal government, with varying connections with the USAID and the World Bank (Kauko et al., 2016; Centeno, 2010). One turning point was decentralization, a common feature in post-dictatorial South American countries that was recommended by the World Bank (Meade and Gershberg, 2008), which then created a typical environment requiring a soft steering tool such as federal QAE. During the 1990s, Brazil developed federal standardized tests. At the turn of the millennium, it participated in UNESCO and OECD international large-scale assessments. After this, the systematization, strengthening, and broadening continued nationally (Kauko et al., 2016; Suominen et al., 2018). At the same time as Brazil has developed its federal QAE capacity, the role of the international organizations has diminished and focused on state and municipal projects. In addition, the role of civil society movements utilizing QAE data has become significant. (Kauko et al., 2018b). However, many governments in the past have aspired to improve the country's PISA ranking (Kauko et al., 2016). In general, the federal governments of Brazil have had an interest in being part of the PISA survey and have also been active in other ILSAs. Internally, the federal standardized tests, and different state and municipal level QAE measures, create a web of interconnected testing and a strong regime for their use in distributing resources and local decision making.

Chinese education is a huge entity. The current system is organized under the national Ministry of Education, with provincial, city, and county or district administrative layers (Zhou, 2019). In the twentieth century, after the establishment of the People's Republic of China in 1949, the imperial tradition—a decentralized, private, and elitist system—was transformed into a nationalized, centralized, and reformed education system, following the Soviet model. The country's turmoil during the Cultural Revolution seriously disrupted education and the inspection office (Suominen et al., 2018). A new development slowly started after the opening-up policy of the 1980s and 1990s. The opening-up policy and the intensification of the education and quality reforms since the 1990s create an important backdrop for Chinese QAE politics. On one hand, the reforms have bolstered the official position of the party state, but on the other, there are more implementation responsibilities at the local level (Suominen et al., 2017). Historically, Chinese QAE has involved inspection and testing. The current QAE structure consists of an inspection and school quality management system, as well as teacher training evaluation. They target students, teachers, headteachers, schools, and education governments and departments (Zhou, 2019, 72). In addition to selection, testing includes different types of evaluation of learning and school outcomes, as well as high-stakes tests. Public rankings have been officially forbidden since 2010, but they do exist (Zhou, 2019, 43). There is a certain degree of decentralization to the county level in basic education (Kauko et al., 2018b), but the state role is strong compared with Brazil (Rinne et al., 2018). The data-driven large-scale assessment layer is fairly new in China. The introduction of NAEQ (National Assessment of Education Quality) was a marked shift. It was first piloted in this sense in 2007. Its purpose is data gathering, with standardized tests for official and political use (Suominen et al., 2018, 55). (Zhou, 2019, 50) summarizes the work of other scholars by saying that the large-scale assessment, NAEQ, is a result of international emulation by China. NAEQ was also seen as a solution for systematic, nationwide, and first-hand data (Piattoeva et al., 2018). China as a whole has not participated in international large-scale assessments, but its regions have been involved in PISA. The diverse Chinese education landscape is subject to many different QAE measures. However, international ones are not strongly present, although there is some evidence that they may have affected the interests in strengthening the national evaluation scheme.

The Russian education system is also a large entity, with two federal ministries and an agency for control and supervision, as well as state, municipal, and private education providers. During the Soviet era, Russian QAE was based on inspection, school reports, and a school census. Much of QAE also worked *ex ante* as trust in the centralized curriculum and teacher training, or relied on the delegation of supervision to the local authorities (Suominen et al., 2018, 56–57). Under-resourced education faced inequality and quality problems. Reforms were started during *perestroika* and implemented after the dissolution of the Soviet Union, and they resulted in a strong decentralization of education, accompanied by partial privatization and commercialization. The reform era of the 1990s was accompanied by the involvement of the OECD and the World Bank, which advocated a standardized testing regime (Suominen et al., 2018, 58). Russian QAE has evolved from the efficiency idea of the 1990s and the broadening and systematizing QAE between 2000 and 2010 into an era of more nuanced data use (Gurova et al., 2015). The Russian QAE reforms in the 2000s were partly a response to the criticism of decentralization. The reform package of the 2000s introduced the influential high-stakes Unified State Exam (USE) and the State Final Attestation (SFA) (Gurova et al., 2018, 2015). Test scores are used as part of quality evaluation for students, school staff, and the education authorities. The local use of their data varies (Gurova et al., 2018). Russia has been actively involved in PISA and TIMSS, and their data is valued. However, national-level experts also emphasize the importance of national traditions (Kallo et al., 2018, 173). In sum, the Russian quality of education landscape is multifaceted in its plurality of decentralized education providers and local influences, while strongly aspiring at the state level to gain control with the aid of QAE.

In peeling the QAE onions of Finland, Brazil, China, and Russia, we can recognize the different layers of QAE. At the same time, the complexity of the structures is striking. The accounts above have been far from exhaustive, but it is hoped they have demonstrated that each country has traditions in education QAE that have not faded in the globalized environment. While education research sometimes tends to focus on the discussion of international large-scale assessments, their role in the national landscape, and especially in relation to everyday schooling, is very limited. It is therefore worth reconsidering what we can say about the politics of quality in education.

Conclusion

The understanding in this article is that the global politics of quality in education is linked to the idea of controlling contingency and politics as mediativity. The attempts to control contingency are manifold. Many QAE measures were introduced after increased contingency in decentralization reforms, and they were attempts to regain control for central administrations. However, the plurality of QAE and the unpredictability of its results have not fulfilled this aim. Instead, the attempts to control contingency with QAE increase the likelihood of “shared and self-reinforcing goal setting,” “authorizing, but diverted governance,” and “destabilizing and reorganized role setting” (Kauko et al., 2018c). The shared QAE agenda is embedded in the networks that involve actors, from the local to the global. This does not imply a causality of agenda and means, but more that an understanding that QAE can solve the question education faces (Kauko et al., 2018c, 183). The authorization QAE affords can help actors in different places specifically as a tool for “inserting general political aspirations into the education system,” but the complexity of implementation usually diverts the effects (Kauko et al., 2018c, 185). When implemented, QAE changes power relations and creates instabilities, as well as supports different actors, as Dahler-Larsen (2012) presents, to the extent that some of its properties as a governance tool can be questioned. In strong top down QAE systems, destabilization usually happens for the subjects of the measurement (Kauko et al., 2018c, 187).

QAE policies have become unavoidable for countries that aim to be taken seriously internationally. Their use extends to the realm of education, including other goals, and it shapes the power of the actors involved. In this regard, the global politics of quality lie not in the policy itself, but more in the politicization it creates: Global understanding has made QAE unavoidable. Its implementation reformulates education itself and the relations of central education actors. The attempt to understand what the politicization of quality entails requires an understanding of what QAE mediates. International large-scale assessments create different kinds of essentialization. There is an understanding that countries and regions compete as equal entities on the global scale—a feature criticized as methodological nationalism in comparative education. Another mediated understanding is that QAE can increase the quality of education. At its very core, this is a circular deduction if we agree that QAE defines the quality of education. This naked understanding of what quality is tears down the facade that QAE builds for quality: There is no other quality than what we define it to be. Quality of education is fictional and only conforms with our political definition. In this regard, the most political, and too seldom asked, question is: How does this definition happen?

Introduction

In 2009, Washington D.C. updated their teacher evaluation system, which preceded a decade long period of reform by states through the country. For the first time schools had collected years of student achievement data allowing for the calculation of Value-Added Measures (VAM). States also invested considerable resources in developing new observation protocols. Teacher evaluation reform also included policies intended to hold teachers accountable and offered incentives tied to their evaluation rating. Incentivized by \$4.35 billion in federal funding from the Race to the Top (RTTT) initiative and federal waivers from NCLB accountability sanctions, 46 states implemented major reforms to their teacher evaluation systems between 2009 and 2016 (Steinberg and Donaldson, 2016). Nationwide schools paid billions of dollars to increase the rigor and scope of teacher performance reviews and build data systems to estimate teacher VAM (Chambers et al., 2013). The reforms led to conflicts between education reformers and teacher unions resulting in prolonged litigation (Paige, 2020).

Researchers have studied teacher evaluation systems since the passage of DC Impact in 2009. Studies have focused on the political dynamics that caused the rapid and ubiquitous spread of state evaluation reforms (Bleiberg and Harbatkin, 2020; Howell and Magazinnik, 2017). Additionally, researchers have examined the degree to which districts implemented state level reforms (Government Accountability Office, 2015; Kraft and Gilmour, 2017; NCTQ, 2019). Studies have also developed theories about how teacher evaluation systems could influence students and teachers (Goldhaber and Hansen, 2010; Liebowitz, 2021; Loeb et al., 2015; Rothstein, 2015). Scholars have also examined the degree of bias in teacher evaluation systems and the degree to which evaluation reforms promoted more equitable education systems (Campbell, 2020; Chi, 2021). Finally quasi-experimental and experimental studies have examined the effects of teacher evaluation on student outcomes and teacher labor markets (Adnot et al., 2016; Cullen et al., 2021; Dee and Wyckoff, 2015; Kraft et al., 2020; Sartain and Steinberg, 2016).

In this literature review, I look back over the past decade of research to better understand why teacher evaluation was pursued and its influence on education systems throughout the whole country. A considerable portion of the research on teacher evaluation reform was conducted in specific districts or states. I synthesize results across from a variety of local contexts and disciplines. Summarizing patterns across diverse literatures will help to produce nationally generalizable and policy relevant conclusions about teacher evaluation.

Research question

I ask several questions about teacher evaluation systems:

1. What was the theory of action underlying teacher evaluation?
2. What is known about the causes of teacher evaluation adoption and the fidelity of implementation?
3. What was the effect of teacher evaluation on students and teachers?

In the subsequent sections I describe the procedure used to review research on teacher evaluation. I then discuss the theory of change motivating teacher evaluation reform. Subsequently, I summarize the political forces that led states to pursue teacher evaluation reforms and the evidence for whether the reforms took root. I then summarize the empirical literature on how teacher evaluation influenced student outcomes and teachers. I conclude by discussing the implications for future reforms to teacher evaluation systems.

Methods

I began by conducting a systemic review of research studies that were published in peer reviewed journals (Petticrew and Roberts, 2005). I collected articles using the Education Resources Information Center (2022) descriptor “teacher evaluation”. I then conducted a supplementary search for “teacher evaluation” using Google Scholar to ensure that all relevant journal and “gray literature” research was identified. The first step of the search yielded 2388 peer reviewed articles. After screening the abstracts for relevance, 192 articles remained. After a second more detailed examination of the reading and methods the remaining 86 studies were synthesized. I then grouped the findings into categories based on the research questions and summarized the results.

Mechanisms

Researchers have identified two main channels through which teacher evaluation reforms may influence the effectiveness of teachers and subsequently student outcomes. First, teacher evaluation may alter the composition of the education workforce by using incentives to attract candidates and exiting teachers with low ratings. Evaluation ratings were used for a variety of purposes in high stake systems. School leaders could use evaluation ratings to determine who to hire, layoff in case of a reduction of force, grant tenure, promote, and dismiss (Dee and Wyckoff, 2015; Loeb et al., 2015; Neumerski et al., 2018). Evaluation systems also offered incentives to effective teachers. The combination of financial incentives and high-stake accountability was theorized to keep high quality teachers in the classroom and induce the exit of low-quality teachers (Goldhaber and Hansen, 2010; Staiger and Rockoff, 2010). A study in New York City Public Schools found providing principals with value-added scores can improve teacher quality overall by leading to the exit of ineffective teachers and retention of effective teachers (Rockoff et al., 2012). The evidence from the VAMs changed how some principals appraised the quality of teacher’s instruction.

Teacher evaluation will improve teacher quality overall if it causes the exit of ineffective teachers and leads to the recruitment and retention of effective teachers. Simulation studies have found that the conditions under which high stakes teacher evaluation will improve teacher quality are infeasible in many contexts (Liebowitz, 2021; Rothstein, 2015; Sartain and Steinberg, 2021). High-stakes systems that tied bonuses and granting tenure to evaluation ratings only improve teacher quality if paired with very high salaries and excess teacher supply (Rothstein, 2015). Simulation studies have also found that high stakes evaluation systems with instructional supports for all teachers are less effective than other policy designs (Liebowitz, 2021). The optimal evaluation reform would focus accountability policies on only low performing teachers while offering instructional supports to all non-low performing teachers. Teacher labor supply would exceed the quality of ineffective teachers in only a portion of larger urban metropolitan areas (Sartain and Steinberg, 2021; Stecher et al., 2018). Overall simulation studies make important assumptions about the composition of the local labor market that are unlikely to hold in many contexts (e.g., outside of large cities).

Second, teacher evaluation may improve the performance of current teachers by improving instructional practice. More specifically evaluation systems can provide teachers with the resources they need to improve their practice through data, coaching, or other professional development (Donaldson and Firestone, 2021; Galey-Horn and Woulfin, 2021; Mintrop and Trujillo, 2007; Woulfin and Rigby, 2017). States invested considerable resources in training evaluators to provide high quality feedback (Kraft and Christian, 2022). Providing detailed and teacher specific feedback was theorized to be a powerful engine for instructional improvement (Hunter and Springer, 2022).

The high-stakes accountability provisions of teacher evaluation systems (e.g., dismissal, granting tenure, merit pay) could also improve teacher quality by improving extrinsic motivation (Firestone, 2014). Teacher evaluation systems may include a variety of high-quality data including student outcomes, observation protocols, and student surveys. Systems that use all three measures of teacher quality produce the most reliable evaluation ratings (Doan et al., 2019; Kane et al., 2013). That implies that teacher evaluation systems do contain information that is useful for improving instructional practice.

History of state adoption

Beginning in 2010, RTTT offered states that were struggling during the Great Recession large grants in return for adopting education reforms including teacher evaluation. (Bleiberg and Harbatkin, 2020; Howell and Magazinnik, 2017; McGuinn, 2012). Concurrent with RTTT, the Bill and Melinda Gates Foundation invested billions to encourage states to pursue teacher evaluation (Reckhow et al., 2021). The implementation of teacher evaluations systems started to increase in 2010 and spiked in 2012 and 2013. Between 2011 and 2016, the vast majority of states adopted teacher evaluation reforms (Steinberg and Donaldson, 2016). Beginning in 2012, states seeking a waiver from No Child Left Behind (NCLB) requirements to reach 100% proficiency by 2014 were required to adopt teacher evaluation reform. By 2016, 44 states had passed major teacher evaluation reform legislation

(NCTQ, 2016)—shifting away from evaluation systems that relied primarily on observations and were not tied to consequences for teachers (Steinberg and Donaldson, 2016; Weisberg et al., 2009). For states that adopted, implementation continued largely through the 2017 school year, after which states submitted their Every Student Succeeds Act (ESSA) plans. Under ESSA, states recovered more autonomy in setting education policy and many amended their evaluation systems (Ross and Walsh, 2019). School districts also pursued teacher evaluation reforms independently of state efforts. Many school districts made changes to their systems in advanced of state reforms.

Political dynamics causing state teacher evaluation reform

A complex set of intergovernmental dynamics led states to adopt teacher evaluation reforms. The political forces that drove adoption of teacher evaluation systems include: downward vertical diffusion, upward vertical diffusion, intermediary organizations, and internal determinants. Research has examined the role that each dimension played (Bleiberg and Harbatkin, 2020; Howell and Magazinnik, 2017, 2020; McGuinn, 2016; Wong, 2015).

Downward vertical diffusion

Downward vertical diffusion describes a “top-down” approach where the federal government compels the adoption of a policy. The Constitution limits the ability of the federal government to directly proscribe state education policy. To circumvent that constraint, the federal government requires states to pursue specific education reforms in return for accepting funding. Vertical diffusion is a more potent force during recessions, when states want to raise funds without raising taxes. The housing market crash during the Great Recession caused a corresponding decrease in state education funding that relied on property taxes (McGuinn, 2016). This unique set of political circumstances temporarily decreased congressional gridlock and led to the passage of the American Recovery and Reinvestment Act. The legislation prioritized quick action by the Obama administration and included billions in education via the RTTT competitive grant program. RTTT’s competitive grant making process is an example of “executive federalism”, which describes when the President strategically employs the powers of the office to encourage state reforms (Gais and Fosssett, 2005; Howell and Magazinnik, 2017). Executive federalism employs two complementary approaches to encourage state policy adoption. Voluntary compliance is essential because the executive lacks the power to compel action. Simultaneously, the federal government can install inflexible goals for the types of policies that states may put into place. In their pursuit of teacher evaluation reform, the Obama administration followed a strategy that was “tight” on goals but “loose” in how states could demonstrate compliance.

RTTT was a highly effective example of executive federalism. RTTT caused states to adopt teacher evaluation through exploiting fiscal pressure (Howell and Magazinnik, 2017). RTTT also indirectly raised the salience of teacher evaluation for the media and state legislators. The effect of the RTTT on adoption of teacher evaluation policies is clearly observed from the times when federal and state policy occurred. RTTT was announced in 2009 and the first round of competitive grants was awarded in March 2010, which was followed by round 2 in August 2010. 9 out of 10 RTTT grant winners from rounds 1 and 2 adopted teacher evaluation reform. After the first two rounds states (i.e., Alaska and North Dakota) that were not competing for RTTT grants began pursuing teacher evaluation (Meredith, 2013). Two states adopted despite not applying for RTTT in either round. California and Maine repealed laws that prohibited using student data for teacher evaluations (GAO, 2011). The Obama administration announced the NCLB waivers in 2012. To receive a waiver, states were required to reform their teacher evaluation systems. The waivers were a relatively less effective tool for compelling states to adopt teacher evaluation (Wong, 2015). In part because the waivers did not come with the financial incentives offered by RTTT. Additionally, most states that were willing to adopt teacher evaluation had already pursued that reform by 2012.

Upward vertical diffusion

Upward policy diffusion occurs if states adopted teacher evaluation in reaction to district implementation. State leaders monitor local politics closely to help assess support for potential future action (Kingdon, 2002). In the case of teacher evaluation, the implementation of district systems provides valuable data to assess the viability and support for state wide teacher evaluation reforms. Additionally, after district implementation, policy entrepreneurs will engage in “venue shopping” or engaging in efforts scale up a reform (Mintrom, 1997; Shipan and Volden, 2006). Teacher evaluation advocates build their internal policy networks at the state level and then engaged local political groups to strengthen their coalition (Mintrom and Vergari, 1998). Legislators engage in a similar process by borrowing political support for their own policy objective (Manna, 2006).

The effect of district implementation of teacher evaluation on state reforms appears to be relatively weaker than vertical diffusion down (Bleiberg and Harbatkin, 2020). In seven states where large districts implemented teacher evaluation there was no subsequent policy by the state. However, large districts implemented prior to state adopt of reforms in five states (i.e., Connecticut, Georgia, North Carolina, Pennsylvania, Texas) and districts adopted the same year as the state in Colorado and Florida. Bleiberg and Harbatkin (2020) find that the odds of teacher evaluation adoption were 6 times higher in states in which a large district implemented. In many cases early state adoption preceded district implementation, making it impossible to know whether vertical diffusion could have played a role.

Intermediary organizations

Foundations and the non-profits they fund played a key role in leading states to adopt teacher evaluation. Donations to education focused foundations have increased substantially over the last quarter century (Reckhow and Snyder, 2014). Foundations built strategic partnerships with districts and states that had interest in teacher evaluation prior to federal reform efforts (Reckhow, 2012). Education foundations leverage the fundraising networks that exist between foundations and other non-profits. Foundations frequently give to the same organizations, which multiplies the effect of education reform efforts (Reckhow and Snyder, 2014).

The contributions from the Gates Foundation were particularly impactful because they came before federal reform efforts. In 2009 the Gates Foundation provided funding to 5 states and 6 districts that would each subsequently reform their evaluation systems (Bleiberg and Harbatkin, 2020). The Gates Foundation appears to have caused states to adopt teacher evaluation both directly through their grants and providing technical support (Meredith, 2013). The Gates Foundation also provided grants to districts that implemented teacher evaluation systems and ultimately resulted in upward diffusion.

Internal determinants

Prior research on the innovation and diffusion of education reforms has shown that internal determinants can drive states to pursue state education policies. For example, a weak labor supply could have caused states to pursue teacher evaluation (Berry, 1994; Berry and Berry, 1990; Doyle, 2006). State politics can also play an important role. More specifically a gubernatorial candidate may choose to focus on education issues (Henig, 2013). Alternatively, teacher evaluation reforms may fail due to political organizing by the teacher's union (Moe, 2011). About one in three states reported challenges related to maintaining teachers' union support for teacher evaluation reforms (Government Accountability Office, 2015). States were more likely to adopt teacher evaluation if the Great Recession caused a relatively modest decline in state education spending and were more responsive to RTTT if they had previously invested in education reform (Howell and Magazinnik, 2020). However, Bleiberg and Harbatkin (2020) found no economic or political measures that were correlated with state teacher evaluation adoption. In the context of teacher evaluation, it appears that the intergovernmental political dynamics were the more salient factor.

Implementation of state reforms

Teacher evaluation system design and implementation varied considerably across and within states. The vast majority of states provided local districts with some degree of autonomy in implementing teacher evaluation, either by allowing local discretion within a state-designed system or allowing districts to develop their own systems given a set of guidelines (Steinberg and Donaldson, 2016). As a result, the implementation of teacher evaluation was uneven both across and within states.

The federal government promoted a specific model of teacher evaluation through RTTT and the waivers. However, states chose to adopt some evaluation components more frequently than others. Most states that won RTTT grants chose to (1) require student achievement growth, (2) use multicategory rating systems, (3) require annual evaluations, (4) mandate that evaluations were used for professional development, and (5) to use evaluations as a component of dismissal decision (Dragoset et al., 2016). Far fewer states chose to use evaluations to determine bonuses and career advancement. Many also did not include student surveys that were found to improve the reliability of evaluation systems (Kane et al., 2013).

Most states provided school districts with discretion over the implementation of teacher evaluation systems (Steinberg and Donaldson, 2016). States frequently required districts to design their own systems that met state guidelines. For example, some states required the use of student data but were agnostic to whether districts used very different measures (i.e., Value-Added Measures vs. Student-Learning Objectives). School district documents from the National Council for Teacher Quality (NCTQ) teacher contract database provide the clearest view of the evaluation systems that were implemented by school districts (NCTQ, 2022). The database includes Collective Bargaining Agreements, teacher evaluation handbooks, and other district materials from about 150 school districts including the 100 largest districts in the country, the largest district in each state, and member districts of the Council of Great City Schools. The vast majority of school districts have policies in place requiring teacher evaluation. About nine in ten required annual evaluations for non-tenured teachers and about one in two states required annual evaluations for tenured teachers. Similarly, the overwhelming majority (about nine in ten) have procedural rules in place that require districts to share evaluation data either through written feedback or a conference. Far fewer states require teacher evaluations systems to be used for accountability purposes, which is reflected in district policies. About three out of four school districts required student achievement to be included as a component in teacher evaluation systems. About six in ten school districts required evaluations to be used as a criterion for dismissal and four in ten offered bonuses for strong evaluations.

The varied state approaches to system design and voluntary implementation by districts created a national teacher evaluation policy patchwork quilt. Only one in five states installed a unitary teacher evaluation system that districts were required to use. Many states made small changes to their evaluation systems and others allowed districts tremendous flexibility with system design (Bleiberg et al., 2021). As a result, teacher evaluation systems that were intended to be revolutionary in design were quite similar to status quo systems. Teacher evaluation reforms were supposed to identify greater numbers of ineffective teachers and incentivize their exits (Weisberg et al., 2009). However, less than one percent of teachers received unsatisfactory rating in states that reformed their evaluation systems and educators were rarely dismissed for receiving low ratings (Kraft and Gilmour, 2017). Large financial

incentives were theorized to be a powerful force to attract and retain teachers. Most states did not offer bonuses and the financial incentives in states that did were far too small to change behavior (NCTQ, 2019). In Michigan many administrators were unwilling to implement teacher evaluation despite state regulations (Pogodzinski et al., 2015). Michigan required school districts to use student data when making high-stakes personnel decisions. However, many school districts implemented systems that deviated considerably from the mandated policy.

A more practical challenge for teacher evaluation systems are the weaknesses of VAMs used by many evaluation systems. VAM's can be an important component of a system that identifies struggling teachers on average for a whole state (Doan et al., 2019; Kane et al., 2013). But it may still be inaccurate or imprecise for determining whether a specific teacher's performance is unsatisfactory (Ballou and Springer, 2015). Student assignment to teachers is non-random, which likely biases VAM estimates. Teachers can also leverage social networks to choose smaller classes with fewer students that can bias VAM estimates of whether a teacher is effective (Guarino et al., 2014).

Relatedly designing systems that provided teachers with high quality and actionable feedback also proved to be challenging. Training programs and observation protocols that are designed to facilitate instructional improvement for teachers were found to improve student outcomes (Kraft and Christian, 2022; Mihaly et al., 2018). Evaluation ratings do not appear to change their professional improvement activities (Koedel et al., 2019). In Tennessee teacher a substantively large proportion of teachers received feedback that was unaligned with research-based best practices (Hunter and Springer, 2022).

Evaluation system bias

Evidence from diverse contexts and methodological approaches shows that teacher evaluation systems are biased against Black teachers. The effectiveness of Black teachers is exceptionally strong as proven by their capacity to improve student achievement, social-emotional learning, and attendance for students overall and especially for Black students (Beauboeuf-Lafontant, 2002; Campbell, 2021; Cherng and Halpin, 2016; Dee, 2004; Dunbar, 2008; Egalite and Kisida, 2018; Gershenson et al., 2021; Lindsay and Hart, 2017). Administrators gave systematically lower observation ratings to Black and White teachers that had similar value-added measures (Campbell, 2020; Chi, 2021). Teacher evaluation systems like DC IMPACT that swiftly exited teachers with low performance ratings were "harsh" and inequitably affected non-White teachers (Campbell et al., 2021). "Race neutral" evaluation systems may encourage principals suppress efforts to incorporate culturally responsive pedagogy (Donaldson, 2020).

Unfortunately, retention of early career Black teachers is lower than their peers accounting in part for there being too few Black teachers (Gershenson et al., 2021; Sun, 2018). The shortage of Black teachers is likely caused in part by evaluation systems that are biased against Black teachers (Campbell, 2020, 2021; Chi, 2021). Teacher evaluation increased the proportion of schools with unfilled teacher positions and the effects were larger in schools that served Black and Hispanic/Latino students (Kraft et al., 2020). Black teachers are systematically more likely to work in schools with relatively larger proportions of Black and Hispanic/Latino students (Boyd et al., 2011), which implies that teacher evaluation increased attrition for Black students.

Teacher labor market outcomes

Teacher evaluation was hypothesized to improve teacher quality by changing the composition of who teaches. Research from Chicago, Washington D.C., and Houston suggests that teacher evaluation increased the likelihood that the lowest performing teachers voluntarily exited the district (Adnot et al., 2016; Cullen et al., 2021; Dee and Wyckoff, 2015; Sartain and Steinberg, 2016). Evaluation systems also increased the quality of teacher candidates (Kraft et al., 2020). However, research from Pittsburgh, Memphis, and Tampa finds that teacher evaluation had no effect on teacher quality (Stecher et al., 2018).

The inclusion of accountability provisions in teacher evaluation systems likely explains why the effect of evaluation varied across district contexts. In New York City, the teacher evaluation policy required teachers to demonstrate effectiveness through their evaluation to earn tenure. Teachers who did not earn tenure due to low evaluation ratings were more likely to leave their positions (Loeb et al., 2015). Washington D.C.'s evaluation system known as DC IMPACT dismissed teachers who received multiple ineffective ratings. DC IMPACT paired high-stakes personnel decisions with a policy that offered very large financial incentives to the most effective teachers. Taken together the research suggests that receiving a low teacher evaluation rating increases the likelihood that a teacher will exit when combined with other accountability provisions (Dee and Wyckoff, 2015).

Achievement effects outcomes

Rigorous quasi-experimental studies have shown that teacher evaluation improved student outcomes in some but not all districts. On average throughout the whole country, it appears that teacher evaluation did not have an effect (Bleiberg et al., 2021). Evidence from Cincinnati, Chicago, and Washington D.C., suggests that teacher evaluation can improve student outcomes. Taylor and Tyler (2012) use Cincinnati Public Schools data from 2003 to 2004 through 2009 to 2010 showed that a teacher evaluation reform including classroom observations and formative feedback increased math but not reading test scores.

Steinberg and Sartain (2015) used an experiment to show that a pilot evaluation system in Chicago caused large increases in reading achievement, but substantively insignificant results for math. The evaluation system produced significant improvements in reading achievement and positive but imprecisely estimated effects in math in the first year. No positive effects were found in the second year, likely due to challenges relating to scaling the evaluation system or an inadequate supply of high-quality teachers. Teacher evaluation reforms in Chicago emphasized providing formative feedback to improve instruction. However, a second study of the Chicago teacher evaluation pilot found that a likely explanation for the positive effects was teachers choosing to leave after receiving low ratings (Sartain and Steinberg, 2016). Chicago's pilot evaluation system did not include a provision to dismiss ineffective teachers. However, teachers that received low evaluation ratings were 10% more likely to voluntarily exit Chicago Public Schools.

DC IMPACT included intensive professional development for teachers with large bonuses and dismissal for repeatedly ineffective teachers (Adnot et al., 2016; Dee and Wyckoff, 2015; Dotter et al., 2021; James and Wyckoff, 2020). Dee and Wyckoff (2015) found that DC IMPACT increased student outcomes through changing the composition of the teacher workforce. Student achievement increased when minimally effective teachers voluntarily exited (Adnot et al., 2016). Data from observations shows that teachers spend time preparing for evaluations, which improved their subsequent ratings (Phipps and Wiseman, 2021). The positive effects of DC IMPACT appear to be sustainable after many years of reform and iterative changes to evaluation policy (Dee et al., 2021).

Several studies have also found that teacher evaluation had no effect on student outcomes or in some cases small negative effects. One nationwide study examined the effect of evaluation systems in Pittsburgh, Memphis, Tampa, and four Charter Management Organizations (CMOs) supported by the Bill and Melinda Gates Foundation. Researchers found evidence that teacher evaluation systems were fully implemented including incentives and high-stakes accountability, but standardized test scores remained about the same compared to the period prior to the reform (Stecher et al., 2018). The evaluation systems in these districts attempted to tailor professional learning based on the needs of individual teachers by providing feedback through several observations. Teachers viewed these changes as unsubstantial and noted that most teachers had the same evaluator multiple times. Cullen et al. (2021) found that teacher evaluation reforms in Houston increased turnover for the least effective teachers. However, the resulting improvement in teacher quality was insufficiently large to substantially increase student achievement. A study of teacher policy reform in Michigan that included teacher evaluation found no effect of the reform on student achievement (Anderson et al., 2021). A recent national study of state teacher evaluation reform found no effect on student achievement or attainment (Bleiberg et al., 2021). They estimate null effects with enough precision to rule out positive effects larger than 1.5% of a standard deviation for achievement and 1% point for high school graduation and college enrollment.

Discussion

In the few locations that were able to implement reforms with fidelity there is evidence that teacher evaluation benefitted students. Students can benefit from a DC IMPACT style evaluation system, but only if policymakers wholistically embrace DC's approach to reform. DC IMPACT created historically large financial incentives for teachers. Teachers who received a highly effective rating for two consecutive years were eligible for a base pay increase of between \$10,000 to \$450,000 (Dee and Wyckoff, 2015). Funding for the bonuses was provided by philanthropic foundations and considerable human resource investments were made in the central office to administrate DC IMPACT. DC also committed to using highly qualified peer evaluators to conduct observations. The level of organizational effort to implement and organize DC IMPACT is unique and unlikely to be replicated.

The improbability that other states or districts would pursue DC style evaluation reform is motivated by the history of past efforts. After the Great Recession, cash strapped states faced unprecedented fiscal and political pressure to reform evaluation systems in exchange for RITT dollars. Most state chose systems that differed substantively from DC and did not include changes to compensation or high-stakes accountability. State policymakers calculated that the political and financial costs exceeded the potential benefit. Today in the absence of the political dynamics that led dozens of states to pass evaluation reforms, the likelihood of a renewed investment in improving evaluation systems is diminished.

Reformers hoped that changes to teacher evaluation would improve teacher quality and close achievement gaps while also raising student outcomes overall (Weisberg et al., 2009). Overall, throughout the country it appears teacher evaluation did not improve outcomes or benefit minoritized groups. There are many legitimate uses for the evaluation systems that were created. Rigorous observation protocols and coaching have the potential to help teachers improve. Data on teacher quality can be a valuable for researchers to help improve education systems. Given the lack of substantially large positive effects and the evidence that evaluation systems are biased states should consider removing high-stakes accountability for teachers.

Introduction

This article, centered on teacher policy frames, its issues and enactment forms, is inevitably limited in coverage. Its focus is mainly on frames considered important for their social and international relevance. Broadly, we understand frames as social constructs that underlay teacher-related policy rather than as the specifically pedagogic ones, although these are embedded in social constructs. More specifically, we use certain areas of teaching and teacher education to illustrate how they respond to policy and how policy affects them. Policy formulation is marked by issues reflecting broader theoretical positions about the nature of teaching (professional or technical), its quality control (professional or accountable/measurable), and its regulatory perspectives (market/private, justice/equity). Policy frames surround the immediateness of educational and societal issues such as international/national tests and teaching quality or education for all and teacher provision. They also serve to deal with the unexpected as exemplified in the COVID-19 pandemic and with future projections, building on evidence of the skills and capacities needed.

We have not been able to cover in this article all of these diverse frames in the extension and depth that would be required. However, we have selected overarching frames such as New Public Management (NPM) and Accountability to examine their contemporary impact on teachers and teacher education across different countries. We have examined enactment of such frames in teacher career systems around the world, and also referred to large scale testing (national and international) and to arguments regarding its effect on teacher and teacher education assessment. We have also moved the focus of our analysis to the role of international organizations in broadening policy frames along the lines of teacher preparation for inclusion and the enactment of inclusive classrooms, as well as in mapping the future and teacher preparation in this respect. We have finally highlighted that social justice and equity principles and practices, must find their place in teacher education and professional development in order to render inoperative in classrooms, the “silent exclusion of student identities.”

Teacher-related policy: contemporary issues and discussions

Teacher policy, whether international or local, reinstates traditional themes and attends to new or more specific policy issues. Thus, its formulations cannot but address questions about who should become a teacher, how should teachers be prepared, what criteria is needed to assess teaching quality and who should assess it, as well as how and under what conditions do teachers perform competently. But adequate policy responses to these traditional issues also need to be relevant to changing educational conditions and contexts as well as to the foreseeable future. More specifically, while teacher policies must rest on the longstanding acknowledgment of teaching as a profession ([International Labour Organization, 2016](#); [Hargreaves, 2000](#); [Darling-Hammond and Sykes, 1999](#); [Hoyle, 1974](#)) they should also take on discussions and research evidence on the changing forms and important nuances of teaching. This means that teacher policy needs to be broad enough to allow for divergence in its enactment, relevant to teaching in poor societies and economies with low education levels ([UNESCO, 2014](#)), as well as adventurous in promoting the development of “21st century skills” in all school populations ([IDB, 2019](#); [Reimers and Chung, 2016](#)).

We begin this section, by taking on a theme which was absent at the moment of planning this article: the irruption of COVID-19 and its challenge to existing policy and practices. We then move on to discuss the nature of teacher policy discussions, frames and teacher research in the 2000s. And finally, we provide an up-dated view of teacher policies from the perspective of their global nature and impact.

The irruption of COVID-19 and challenges to existing policy and practices

In 2020 closure of schools around the world thrust teachers, students and their families, into a re-designing of their teaching and learning modalities, and the developing of acute teacher capacity to gauge students' response, both cognitive and emotional, to the changed forms of schooling. Research and studies had alerted schools and teachers that communications were being revolutionized by technology and that quite different modes of accessing and managing communication were expanding globally (Rivas, 2019). Yet, in his analysis of teacher preparation for demands of COVID-19, Schleicher (2020) concluded that most education systems covered by the OECD's round of PISA 2018 were not ready for digital learning in school situations. Only younger teachers using technology in teaching could be considered prepared. Faced with the pandemic, global institutions such as the United Nations, UNESCO and OECD rapidly produced broad orientations to guide the thinking and acting of policy makers as well the enactment of relevant school practices. Also, in the light of the pandemic's effect over inequality, discrimination and student exclusion in different contexts and situations, a dynamic state of policy development reaffirmed the *raison-d'être* of education as a human right (United Nations, 2020), and its broadening to include the right to "connectivity" and access to knowledge and information via free and open source technologies (UNESCO, 2020a). There were suggestions on how to manage teaching where internet connection lacked or failed and global institutions encouraged the prompt opening of schools with important and needed safeguards in place (OECD, 2020). Also affirmed was the importance of the teaching profession and of teacher collaboration in conditions of autonomy and flexibility (Reimers and Schleicher, 2020; UNESCO, 2020a) as well as trust in teacher capacity to lead schools "forward in the post-pandemic world" (Sahlberg, 2020).

Reports and studies have increased with some examining the opportunity provided for teachers to establish closer connections with parents and develop different and creative ways of teaching cooperatively (Hundred Org, 2020; CIAE et al., 2020). Others have endeavored to learn how teachers manage the new context and its complexities, reaching similar findings about the importance of personal and pedagogic experiences. Different countrywide surveys provided knowledge on how teachers face COVID both personally and professionally. In India, Hassan et al. (2020) reported on teacher problems with bandwidth, internet and support in use of online platforms, also occurring in all less affluent countries. In Sweden, Bergdahl and Nouri (2020) reported on teacher dissatisfaction with their pedagogical preparation in facing the new demands. And Kraft et al. (2020) studied conditions in the United States (USA) enabling teachers to cope, such as good communication systems in their schools, collaboration and principal leadership. The rest of the story is still to be written.

Teacher policy frames in the 2000s

Moving back from COVID-19 we deal here with teacher policy accountability frames and persistence of new public management approaches. These policies are contrasted with those based on human rights' orientations, sustainable development, social justice and equity. As extremes of a continuum these policy approaches rest on different theoretical assumptions and empirical evidence regarding the purposes of education and its processes. In their pure forms they do not mark the major orientation of education systems, but in some they tend to be more pronounced than in others. We examine below the nature of discussions around these orientations.

New public management policies

In the second decade of the 2000s educational policy analysis and discussions around teachers continued to be centered on the impact of neo-liberalism on education. Critical assessments focused on its re-shaping and influence over potential loss of teacher autonomy in Hong Kong (Lee et al., 2019), the marketization of schooling in Australia (Hogan and Thompson, 2019), and on "fast policy" effects in Sweden over teachers as individuals and on democratic and professional values (Hardy et al., 2019b; Bergh et al., 2019). More broadly, in the context of neo-liberal policies, recent policy analysis and teacher research in different education systems have taken up persisting issues related to new public management and teacher performance accountability.

New public management (NPM) policies apply management theories and practices to public service administration, including education. Their effect has been to alter the longstanding view of education as a public good, and to foster policy beliefs that education services are more efficiently and effectively regulated by market forces (Grace, 1994 cited in Tolofari, 2005). In an educational market system, schools are classified according to test results that drive parental school choice, and public funding follows student numbers (Tolofari, 2005). Broadened to include the notion of "performativity", NPM conceives educational services as managed by a:

combination of enforced standards and accountability (e.g., national tests, school inspections), devolution and diversity (different types of schools running core curriculum programs and specializing in some areas of their choice), flexibility of employment (for teaching professionals at different levels), greater choice (wider variety of schools and the consumer having real power to choose) and managerialism.

Peters (2004) in Tolofari (2005, p. 86).

The above description of NPM policies applies to policy frames in several systems around the world, including England after the 1988 Education Reform Act (Gewirtz et al., 1995), the United States and Australia (Dunleavy et al., 2006) as well as in Asia, Africa and Latin America (Kapucu, 2006). Enactment of neo-liberal and NPM policies in Chile from the early 1980s, included the introduction of a voucher system of school funding and the implementation of large-scale school testing (Ávalos and Bellei, 2019). Brazil modified its public administration and education system along managerial concepts with the enactment in 1995 of the Public

Administration Reform Plan, and the opening of greater private participation in the conduction of public policy (da Rosa, 2019). Brazilian reforms also introduced large-scale assessments to monitor school quality and student learning, limiting the taught curriculum to testing demands, performance bonuses and external auditing (da Rosa, 2019).

Recent critical analysis of NPM policies has remarked on its narrow interpretation of the word “evidence”, a concept increasingly used to declare the worthwhileness of educational practices (Helgetun and Menter, 2020). According to this interpretation, evidence is a quantifiable expression of policy application influencing what Mockler and Stacey (2020) call its “datafication”. Such misuse of the word “evidence” overlooks much of what is understood as such in educative acts: substantive knowledge, social interaction, power, and the values and norms that guide or should guide education activities (Biesta, 2010).

In its relation to teachers as professionals, NPM policies have impacted on the occupational value of teacher professionalism (Evetts, 2014). They have done so via the introduction of controls over teaching such as standards and external forms of regulation while maintaining the traditional discourse that extolls teacher identity, authority, work culture and collegial relations, among others.

Teacher accountability policy mutations

To be subject to the supervision of another and not do as one sees fit, is altogether convenient.

Aristotle, *Politics* VI, 4.

Government authorities and education policy-makers have always sought evidence for the impact of education and the good use of public investment in schools, teaching and learning. For most of the 20th century this task was entrusted to school authorities and to external inspectors who observed classrooms and took note of teaching quality and its effects. In the United States (USA) as documented by Jewell (2017) teachers considered to lack competence could be subject to dismissals from the school, transfers from one school to another, changes in teaching subject or in class responsibilities. In England an inspectorate system monitored school and teacher performance (Her Majesty’s Inspectorate) until 1992 when it was replaced by the Office for Standards in Education, Children’s Services and Skills (Ofsted). Inspectorates also existed in European countries (Pons, 2014) charged with monitoring school administrative and educational performance and continue to be in place in many Latin American education systems. However, as we shall see below accountability progressively took on new forms of examining teacher performance and evaluating its quality. We examine below accountability policies as developed and implemented in three English speaking countries, which are selected because their systems have influenced such policies in other geographical contexts.

Teacher accountability in the US, England and Australia

With the publication of *A Nation at Risk* (National Commission on Excellence in Education, 1983) policy attention in the USA was directed to furthering teacher professionalism based on the analysis of what is involved in good teaching and the use of relevant generic teaching standards to assess teacher performance (Hunter, 1982; Danielson, 2007). Teacher performance assessment could involve the use of observation tools and appropriate interviews as a responsibility of school authorities or other qualified professionals. However, with the passing of the *No Child Left Behind Act* (2001) there were changes to the education system that affected teacher evaluation. These included the use of “standardized tests aligned with challenging academic achievement standards” (US Department of Education, 2002 cited in Hursh, 2005) and the requirement of more precise measures of teachers’ performance. Teachers were gradually incorporated into a test-based teacher and school accountability system that included Value-Added measures (VAM) to determine teachers’ impact on student learning (Holloway et al., 2017). The later *Federal Race to the Top* initiative (RTTT, 2009) moved the accountability system further by providing financial rewards to states that linked student data to teacher evaluation scores (Jewell, 2017). The next policy instrument, known as *Every Student Succeeds Act* (ESSA, 2015) introduced some moderation to teacher evaluation by moving it away from uniform student national testing toward state assessments, without necessarily requiring the association of teacher performance with student test results. As a whole, these policies resulted in largely different systems of teacher performance assessment and accountability across the USA states (Jewell, 2017).

Teacher quality and its effect on economic earnings add another perspective to teacher accountability discussions. On the basis of research examining student scores on standardized tests and their longtime effects on economic gains (individual and national growth rates) together with teacher value-added analysis, Hanushek (2019) concludes that very effective teachers have a bigger impact over their student future earnings compared to impact of the least effective ones. The same would be true of the aggregate impact of effective teachers over all USA students and their higher incomes and therefore over national economic growth. Solutions based on hiring good graduates from teacher education and/or improving teacher quality through professional development would not be effective given inconclusive evidence cited about the quality of these programs. Therefore, Hanushek (2019) concludes that his evidence establishes a strong case for judging the efficacy of policies such as initial teacher education or professional development. It should be noted though, that Komatsu and Rappleye (2017) contested on statistical grounds part of the evidence cited by Hanushek linking student scores on standardized tests to economic growth. They further contend that linking school results to economic growth may be empirically verifiable, but that it is altogether different from propagating this as a view of education. Setting economic gain as the goal for education may be detrimental to the wider aims of student learning.

The British school system was substantially altered along market principles and structures with the 1988 Education Reform Act passed during Margaret Thatcher's government (Gewirtz et al., 1995). Its key change was to modify the school funding system on the basis of weighted per capita (Acquah, 2013), promoting a context of school league tables and competition (1992). Schools became accountable to the Office for Standards in Education (Ofsted) on the basis of national tests and examination results (Acquah, 2013). By 1995 the English system had introduced ranking by means of Value-Added Measures (VAM), although between 2006 and 2010, the VAM was reconfigured as "contextual value-added", taking into account student prior achievement, eligibility for free school meals and lack of spoken English at home (Acquah, 2013). Teachers, as individuals, in the English system were not subjected to accountability forms similar to those in the USA. They continued to be evaluated by school authorities on the basis of performance standards established by the Department of Education (Department of Education, June 2011). However, strong pressure on teachers to improve school results and position on league tables, raised their efforts to ensure curriculum delivery rather than attend to student understanding, thus encouraging teaching-to-the-test practices (Pring et al. in Acquah, 2013). As reported in Keating's (2015) case study of the English accountability system, teachers' lost autonomy and possibility to innovate in their teaching became aligned with their emphasis on teaching only core subjects examined.

In Australia, the National Assessment Program-Literacy and Numeracy school testing system (NAPLAN) in place since 2008 affected curriculum approaches and forms of teaching, especially in states where school results did not correspond to expectations (Hardy et al., 2019a). Concerned with increased "datafication" in the Australian system Mockler and Stacey (2020), interviewed 21 teachers recruited via social media to learn about their disposition to use quantified data and/or research as sources for valid and reliable evidence of practice, and also surveyed a sample of 524 teachers on these issues. They found that the teachers studied were less enthusiastic about working around data indicators, although disposed to work with research evidence as they were to do so with data.

Teacher performance assessment and accountability demands in other countries have followed to some degree the USA path, though stopping short of using standardized test results as part of teacher performance assessment. Seeking to unveil what kind of systems and national contexts use performance-based pay in their teacher evaluation systems, Aoki and Rawat (2020) examined 2012 PISA teacher data, distinguishing between more and less liberal types of government, and other country-related variables. The researchers found that performance-based teacher pay tended to be used more in less liberal countries as compared to more liberal ones, probably as a way of controlling their public servants (Aoki and Rawat, 2020). There also is evidence that performance-based pay is used in countries with higher commitment to market ideology, and in countries and cultures with varying commitment to reduced state role (Rivas and Sánchez, 2020; Tsz-lok Lee et al., 2019; Appel, 2020).

Accountability in teacher education: holistic or practice oriented

Similar to the narrowing of what is considered as competent teacher capacity, teacher education has been under pressure to account for a narrower range of future teacher competencies than those that were part of standards formulations in the 1990s and early 2000s years. This is the case in different USA states as also in England, with policies that give greater importance to developing specific teaching competencies (lesson preparation, instruction and assessment) and lesser to more broad professional ones. Cochran-Smith et al. (2018) attribute this policy emphasis in the USA to a powerful narrative, that presents teacher education programs as uninterested in selecting good candidates for teaching and that prepare them inadequately for teaching and classroom management (Zeichner and Peña Sandoval, 2015). To deal with these "shortcomings" of teacher education, policies promote the use of strong accountability instruments able to hand-out hard data-driven evidence about the quality of teacher education. This emphasis is noticeable in two USA institutions: The Council for the Accreditation of Educator Preparation (CAEP) and The National Council on Teacher Quality (NCTQ). The CAEP conducts teacher education accreditation in states that require it, while the NCTQ is a private advocacy organization centered on holding public teacher education accountable to the public. Both institutions, despite their differences, share the notion that quality improvement is driven by data (Payne, 2019). Critical analysis by Cochran-Smith et al. (2018) concludes that CAEP is a weak institution in that teacher education accreditation is not required in all USA states, observing also that its accreditation standards and procedures lack "complete support of the profession" (p. 76). As for the NCTQ, Cochran-Smith et al. (2018) point to its market-oriented logic evident in its public displaying of program evaluations based on inputs (syllabi and textbooks), thus expecting to influence program quality on the basis of consumer choice and shaming. To overcome these forms of accountability approaches, Cochran-Smith et al. (2018) argue in favor of what they label as democratic accountability for teacher education. This would require fostering internal accountability of teacher education programs oriented to achieve democratic goals, enhance professionalism, and promote broader notions of teaching and learning, as well as democratic participation and trust.

In England and Wales, university-based teacher education eroded from the late 1980s onwards, due to policy indictment of its quality and the view that schools might do better in training teachers. Thus, currently, acquiring a Qualified Teacher Status in England requires the completion of an undergraduate degree and post-graduate teacher preparation in one of three types of institutions: universities, school consortia or a school-based salaried route into teaching (Meyer and Mills, 2020; Prospects, 2020). In addition, the current guidelines for teacher preparation (DFE, 2019) have been criticized for their narrow emphasis on "training", low expectations about teaching as a profession and insufficient research base (Turvey et al., 2019 in Mayer and Mills, 2020). In contrast to these English teacher education policies, Scotland and Northern Ireland maintain their university conducted Post-Graduate Degree in Education (PGCE) as a requisite for teaching.

In Australia, all teacher education is university-based, although it can be pursued through a number of pathways. However, as discussed by [Mayer and Mills \(2020\)](#), teacher education accountability was tightened in the light of recommendations from the TEMAG 2014 Report (Teacher Education Ministerial Advisory Group) and other documents dealing with accreditation and standards for initial teacher education. These documents have constructed the “right” sort of teacher to be prepared as somebody “who can demonstrate appropriate teaching practice against standards within a system that determines performance indicators and mechanisms for classroom readiness” ([Mayer and Mills, 2020](#), p. 8).

These narrower conceptions of teacher preparation centered more on competence in what is required of classroom teaching or “classroom readiness” but less so on the broader professional capacities of teachers are recognizable in a new instrument originated in the USA as the Capstone Teacher Performance Assessment (EdTPA) and recently adapted for use in Australia (TPA). The material of the USA assessment which is administered by Pearson, a private corporation, consists of a summative gathering by future teachers, of portfolio teaching evidence (assessments, teaching plans, unedited video recordings of teaching, etc.) which are linked to a planned sequence of lessons ([Charteris, 2019](#)). The use of EdTPA in the USA and Australia has been the subject of strong controversy, ([Cochrane-Smith et al., 2018](#); [Charteris, 2019](#)). While acknowledging that teachers are valuable and capable professionals who can be evaluated formatively, the EdTPA also embraces elements of compliance-based accountability and neo-liberal ideology ([Cochrane-Smith et al. \(2018\)](#)). More directly [Charteris \(2019\)](#) views its Australian version as an instrument designed to serve accountability purposes and competing with many other more appropriate measures used in Australia to assess new teacher preparedness (2019). A comprehensive study of peer reviewed articles over ten years ([Stacey et al., 2019](#)) about EdTPA in the USA and its predecessor the Performance Assessment for California Teachers (PACT), examined its relevance for three areas of teacher education: (1) planning and preparation, (2) evidence of teaching practice and (3) student work samples. On the basis of the studies reviewed, the authors conclude that the EdTPA instrument is not able to capture teacher influence over their students’ learning growth over a period of time nor their capacity to teach students with diverse learning needs in diverse contexts. The authors conclude that the TPAs disregard the “context-specific” nature of teaching, are not sufficiently linked to initial teacher education course work, are not able to capture the extent of actual work in the classroom, and assume that teacher candidates are already autonomous agents, which they are not entirely so ([Stacey et al., 2019](#)).

Teacher career policies

Progressively, policies centered on teacher performance quality, work responsibility and performance improvement have taken the form of career paths in a number of countries.

[Tournier et al. \(2019\)](#) carried out a comprehensive review of ten second-generation country career systems, all designed under the influence of neo-liberal principles and use of accountability procedures such as performance evaluation, ladders and merit pay. These included four career systems in Latin America, South Africa, Lithuania, Ethiopia, Thailand and two non-country systems in the state of New York and Scotland. Analysis of the ten systems as well as in-depth cases studies of three of them highlighted a diversity of issues regarding teacher careers, and allowed the authors to regard the Scottish system as a competent system and well supported by teachers.

Many of the countries with teacher careers are in Latin America, and in general these systems have tended to link pay rewards to externally managed performance assessments. Rewards include social benefits such as prizes and cultural goods, social security benefits, salary bonuses and scholarships ([Cuenca, 2018](#)). Mexico was one of the first countries to establish teacher career progression ladders in 2004 and 2005 with pay rewards for teachers externally assessed and who were judged to perform competently. However, from 2013 onwards a new career system took on a much stronger performative emphasis, adding on “consequences” for poorly evaluated teachers such as change of classes, of school or dismissals as such ([Echavari and Peraza, 2017](#)). The new career system has generated widespread teacher protests against what is regarded as “standardization” of their work and weaknesses in the management of the system ([Tournier et al., 2019](#)).

Other systems in Latin America include Colombia, which also has external teacher performance assessment linked to salary increases. The system, however, does not “live up to its promises”. Given that the career’s legislation made salary bonuses subject to availability of public funds, rewards in Colombia are not always handed out arguing lack of funding ([Decreto 1278, 2002](#); [Palabra Maestra, 2017](#)). Chile, legally established a formal teacher career system in 2016 made up of three compulsory and two voluntary stages covering up to twelve years of service. Assessment for progression includes evidence of content knowledge and teaching capacity exhibited in portfolio evidence with standards-based indicators used to classify teachers according to degrees of competence. Teachers failing to pass the third compulsory stage, may not continue to teach in the publicly-subsidized school sector.

Based on their review, [Tournier et al. \(2019\)](#) conclude that while career systems provide more comprehensive modes of evaluating teachers and of rewarding performance quality, their implementation does not always follow the proposed or desirable procedures. Key to good career systems are carefully selected evaluation criteria reflecting desirable performance stages (standards definition), consultation of these with teachers, appropriate evaluation procedures, trained evaluators and financial resources, both to implement the system as well as to comply with any promised salary improvements linked to career progression ([Tournier et al., 2019](#)).

Teacher transnational policy and international organizations

Teacher transnational policy was formally expressed in the 1966 *Recommendations Concerning the Status of Teachers* and in the later concept of social dialog (International Labour Organization, 2016). To monitor compliance with the Recommendations and other matters related, both the International Labor Organization (ILO) and UNESCO coordinate periodic meetings of expert teacher representatives of each of these two organizations. International organizations such as the World Bank and increasingly the OECD take on leadership positions in teacher policy formulations and are subject to differing assessments about their importance and relevance. We consider below ways in which teachers are currently the subject of different transnational institution policies. Teachers encompass a specific policy area in the *Education 2030 Framework for Action* (United Nations, 2015), designed to further progress in achieving “Education for All”, a commitment of international and national government representatives in 1990, in Jomtien, Thailand. The teacher policy focus of the *Framework for Action* is to increase the number of prepared teachers in order to reach the more than 300 million out-of-school children around the world (see: <http://uis.unesco.org/en/topic/out-school-children-and-youth>), a situation that is being substantially worsened due to the impact of COVID-19. Following, on these concerns, the more recently established *International Teacher Taskforce* is charged with furthering the policy of having a “qualified, motivated and empowered teacher in every classroom”. The Task Force consists of representatives of national governments, international organizations, non-governmental organizations (NGOs), civil society and global teacher organizations as well as foundations (155 members). Its secretariat is located in UNESCO headquarters (<https://teachertaskforce.org/who-we-are/our-mission>).

The OECD, largely a European institution in its origins, has nevertheless exerted since the 1990s a transnational influence over education. It has done so through its capacity to generate and disseminate educational information and knowledge and to act as an evaluator (on request) of country education systems (Rinne et al., 2004). Its two main international evaluations—the Program for International Student Assessment (PISA) and its Teaching and Learning International Survey (TALIS)—provide compelling information on student learning as well as on teachers and teaching.

A third important transnational institution as far as teachers are concerned is Education International (EI), the global federation of over 400 teacher unions in 171 countries and territories. Its key role is to safeguard the professional conditions of teachers around the world as established in 15 aims including those in the 1966 Declaration on Teachers, (https://www.ei-ie.org/en/detail_page/4360/principal-aims). Besides this teacher advocacy role, the EI furthers relevant knowledge through research and dissemination and seeks to influence more targeted policy-making through reports for organizations such as the G20 ministers’ conference (Education International, 2018). EI has been a permanent observer on the board of OECD’s Teaching and Learning Survey (TALIS) since its early applications. It has justified this role as crucial, in that it allows the union to exert leverage over data shaping debates and policy around teachers, whether in the form of new possibilities or constraints for its member unions (Sorensen, 2020). More recently, it may have contributed to TALIS’ shift from an emphasis on inquiring about teacher effectiveness and student learning to teacher professional development, self-efficacy, job satisfaction, teaching for inclusiveness and diversity and teacher leadership (Sorensen, 2020).

A fourth type of influential organizations are the World Bank as well as regional banks such as the Interamerican Development Bank (IDB). These bodies lay out education policy including teachers and fund education improvement through loans and grants. The World Bank recently issued what it describes as its first report entirely covering education issues: “Learning to realize education’s promise” (World Bank, 2018). The IDB, in turn, has produced a report on skills development for the 21st century. Both these documents deal with the role of teachers (IDB, 2019).

Arguable matters: global conversations about teachers and teacher education

The influence of international organizations through teacher-related studies, reports and measurements has been the subject of critical policy discussions occurring in different world locations such as Chile and Ireland, (Conway, 2013; Fernández, 2018; Stern, 2013). A contentious issue, for example, refers to the policy listing of “best practices” to be enacted as models for teaching and teacher education. Paine and Zeichner (2012) contend that practice is always “situated” or shaped by the local contexts in which it takes place. Thus, to recommend best forms of practice to be implemented in different geographical contexts is prone to lack relevance. In her comprehensive analysis of global forces and frames that influence teacher policy at national levels, Robertson (2012) equals rankings and benchmarks to global drones that collect information of the terrain, but cannot see the details that make the difference. On the other hand, international country studies not necessarily conclude with a list of worldwide solutions to what may be valid educational problems. They can be genuinely comparative, as was the case of the IEA TEDS-M study of 17 country teacher education systems (Tatto et al., 2012). The study produced broad descriptions and country evidence of teacher education programs and their forms, allowing for analysis of differences and similarities, adequately contextualized.

Of concern also, in relation to international organizations and other global players, is the manner in which reputable educational goals are justified as instruments to foster countries’ global competitiveness (Cheng, 2017; Rönnerström, 2015). Although not necessarily intended to be so, this concern applies to the world-wide emphasis on development of 21st century skills such as creativity and critical thinking, which are central to the OECD Future of Education and Skills Project (OECD, 2018a), or on “global competence” as conceptualized and evaluated in PISA 2018 (Ledger et al., 2019; OECD, 2018b). While agreeing on the key importance of developing 21st century skills, as well as providing compelling evidence for this, Rivas (2019) nevertheless asks an important question regarding its development: who is to control this? Accepting the inescapable move from pencils and blackboards to public education platforms and hybrid modes of teaching, -even before COVID schools were being thrust in this direction- Rivas (2019) answers by pointing at educators. They are those principally charged with setting the scene for 21st century

skills' development, through their: (a) openness to reflect and consider alternative roads, (b) knowledge base, pedagogy and scientific inquisitiveness, (c) empathy and concern for social justice, and (d) mediating the new knowledge world accessed via the information technologies (Rivas, 2019). In a similar vein, Paine (2019) argues in pro of teachers not only taking part but leading discussions on the policy moves which are key for the future. This requires not just "being there", but mainly being heard (Paine, 2019; Horsford et al., 2019).

Social justice, inclusion and teachers

Issues related to inclusion or treatment of differences at school level not only shape national and local discourses, but also travel across countries and influence international policy (Hajisoteriou and Angelides, 2020; Seddon et al., 2017).

Inclusion as a social justice concern is not directly apparent in the concept of education as a basic universal human right, though certainly embedded in this notion (United Nations, 2020). This is because its interpretation is contextual. In its wider meaning, inclusion refers to acceptance and embracing of diversity, as well as correction of excesses against rights as set forth in the United Nations' Declaration of Human Rights (United Nations, 1948). But in its specificity, inclusive education involves recognition in its contents and teaching of a plurality of diversity forms: physical, affective, intellectual, gender-related, ethnic, racial, cultural, among others. Inclusive education is attuned to social justice when it builds on diversity and furthers capability development (Sen, 1999) as also when it contributes to unmask injustice in its various forms (Zemblyas and Keet, 2019, p. 152). Inclusive education embraces the ways in which different student populations bring lived socio-cultural experiences into their learning processes. It does so by respecting the social norms and cultural beliefs of parents and groups to which students belong and that influence their learning (Robeyns, 2006). Teachers and schools must observe and correct in their practices what Srivastava and Sutherland (2017) refer to as the "silent exclusion" of students' identities, be this in relation to gender, class, home language, religion, caste or tribe. More recent challenges for teachers and schools are being brought about by increased world-wide migration.

Equity arguments are not always fair in addressing inclusion. Under a social justice guise, equity arguments were used to justify the development of private schools in England (Verger et al., 2016) presenting race and class inequality as the problem and school segregation as the solution (Horsford et al., 2019; Paine, 2019). Such arguments have also supported the second-class modes of school privatization in Asia and Africa, as well as allocation of "reserved seats" in private fee-paying schools in India for students who belong to "socially and economically disadvantaged groups" (Srivastava and Sutherland, 2017). Clearly, such policies do not serve what has been described above as inclusive nor what is understood as democratic education (Ball, 2007).

The worldwide importance of inclusive education policies in the light of social justice principles underlies the focus of the two most recent Global Monitoring Reports (GMR) (UNESCO, 2018, 2020b) addressing migration and inclusive education needs. Referring to the Sustainable Development Goals (United Nations, 2015), the 2020 GMR clearly defines inclusion not as equality but as equity. From this perspective, the Report deals with the challenges involved in achieving inclusive quality education, and firmly denounces the lack of attention to teacher capability development needs in this respect. More to the point, the GMR version for Latin America provides evidence of insufficient or non-existent teacher preparation for inclusive education in seven countries of the region (UNESCO, 2020c).

Teachers are clearly key players in implementing inclusive policies but, in many countries, they teach in accountability policy contexts that underscore the social and economic factors that impact on student learning gaps (Cochran-Smith and Fries, 2011). In this respect, Hajisoteiou and Angelides (2020) ask an interesting question: "are teachers trapped in a trade-off between efficiency and social justice?". Their response is that teachers can be "empowered" to bargain efficiency and equity if their capabilities are supported by appropriate initial and continuing education experiences, and by their moral and social justice values (Hajisoteiou and Angelides, 2020). Policies can also be appropriated, resisted or modified at the micropolitical school level through joint collaboration of key social actors such as school leaders, teachers, parents and students.

But, are teachers being sufficiently prepared to teach inclusively? A worldwide review of the literature on teacher initial and continuing education by Kubacka and D'Addio (2020) concludes that teacher preparation is mainly restricted to teaching learners with specific disabilities. The authors partly attribute this neglect to the breadth of exclusion forms that need to be considered such as language of instruction, gender differences in STEM (Science, Technology, Engineering and Mathematics)', curriculum subjects learning, inclusion and safety for LGBTI (lesbian, gay, bisexual, transgender and intersex) students, cultures within cultures among others. But also, the suggestion is that faced with the complexity of preparing future teachers to take in the diverse forms of student exclusion, there is need for more reflective modes of learning as in workshops and seminars in order to develop reflective practitioner capacities. Kubacka and D'Addio (2020)'s review did note that teacher education in a number of countries had made some progress in developing attitudes and values related to diversity as well as teacher collaborative practices and on how to create supportive work environments.

Conclusions

The overview of global teacher policy in the first two decades of the 21st century points to a continued impact of the broad frames affecting teacher preparation and teacher work that were subject to critical discussion in the 1990s. Although the recent unexpected global impact of the COVID-19 pandemic over teaching and student learning is and will continue to produce a re-examination of such frames.

Neo-liberal and new public management policies, entrenched in many education systems around the world, have facilitated an increase in school competitiveness and school privatization, especially in Chile and Brazil. National standardized testing has enhanced comparisons among schools putting pressure on teachers to use teach-to-the test practices in order to retain schools' positioning in league tables, and avoid loss of students and school closures. Though, a positive move as far as teacher formal evaluation is concerned, has been the use of contextual value-added measures to assess teacher contribution to learning results, adjusting for prior student academic achievement, achievement of student peers and family background.

Teacher performance evaluation has extended its geographical scope and become part of teacher careers in a number of countries with effects over teacher conditions and contracts. These effects may include salary bonuses or other monetary prizes for good performance, or on the contrary diminished teacher status and position as well as school dismissals if performance is deemed unsatisfactory. Teacher education has also been subject to performance evaluation and accountability through tightened systems of accreditation and standards, and external verification of student teacher content and practical knowledge, in Chile through knowledge testing (Ávalos and Bellei, 2019) and in the USA and Australia through teaching enactment of portfolio evidence. As recorded by researchers in diverse world locations, from South East Asia, Asia, Europe and Latin America, there are many discontented voices regarding teacher accountability forms. Using an international lens, we have referred to different institutions setting global agendas that impact on teachers, teacher preparation and teaching. UNESCO, ILO and Education International continue to express policy concerns about erosions on teacher professionalism, as well as on their working conditions. Through their contribution to evidence on global education needs and issues, the Global Monitoring Reports have examined and proposed relevant teacher-related policy changes. The 2030 Sustainable Development Goals (SDGs) are in danger of not being met given the millions of out-of-school children in poor world locations, unless trained teacher provisions are greatly increased. Teacher policy analysis and proposals in the light of the SDGs make up the substance of discussions by an international task force that includes UNESCO, civil society organizations, NGOs, and foundations.

OECD offers a different approach to teachers and teaching centered on producing relevant information from member and non-member countries on a variety of issues related to teachers' work, education, professionalism and self-efficacy among others. Beyond this role, the OECD, as also the World Bank, produce studies on teacher policy themes of which the most recent ones look into the future and discuss the development of 21st century teaching and learning capacities.

A lingering question related to policy refers to the extent of its implementation. Bruns et al. (2019) present a rather doubtful view of how successful this is. Teacher policy implementation, according to these authors' analysis, is affected by interests and policy views of stakeholders, the opaque character of classroom events as sites of reform as well as the long-term nature of policy impact. Arguably, however, Bruns et al. (2019) also attribute problems with policy enactment to teachers' unions opposition, depending on how professional or militant these are. This and other evidence suggest that policy enactment is never a match application of policy intentions. School communities and teachers reconfigure and recreate policy in the light of conditions and experiences, and it is through discussion with them that policy-makers can reassess or examine implementation effects.

Social justice and inclusion give body to the final policy frame we discuss in this article. Building on a clear distinction between equity and inclusion, we argue for inclusion as furthering social justice by means of valuing all forms of diversity. This goal, however, poses a huge challenge, as in many countries, teachers are not sufficiently prepared to educate inclusively, and/or are under pressure to respond to test results and school classification concerns more than to their students' particular identities.

A final thought as we finish this review, is that there is much to learn from innovative teacher practices and the effect of good policies in supporting these, which we have not addressed. Most recently, faced with the enormous change in schooling produced by the COVID-19 pandemic, and the need to design new forms of teaching using technology if possible, or devising other means, teachers around the world have risen to the challenges involved with greater or lesser success.

Introduction: context and comparison in teacher education

There is a growing international awareness that effective teacher policies significantly improve the quality of education (European Commission, 2012). However, the governance of TE varies between and within countries and much can be learned from comparison. The institutional arrangements and the control of such arrangements through the governance and the policy mechanisms, can be conceptualized as the “context of TE”. More traditionally, the context of education is discussed in terms of policy regulations or as the influence of larger social, economic and cultural factors (e.g., unions and political parties) and conceptually elaborated at different scales: micro, meso and macro. The context is more generally identified as country context and variously conceptualized and taken into account in quantitative and qualitative studies. In more qualitative studies the context is theoretically elaborated as cultural, social and policy context at national or international level or at the intersection of global and local factors, either as case studies (Paine and Fang, 2006; Steiner-Khamsi, 2005) or as comparative scholarship (Mayer and Mills, 2021; Osborn and McNess, 2005; Tatto and Mincu, 2009), and as context of teaching (Zhao, 2018). One review synthesizes several contextual factors from a comparative education perspective (see Tatto, 2008) such as the socio-economic status of parents, children, as well of schools themselves (Robinson, 1994; Fuller et al., 1999), of schooling (Mak, 1999), the political dimension (Ginsburg and Lindsay, 1995; Judge et al., 1994) and culture and language. A more traditional field specific way to tackle with the contextual dimension is the immediate institutional and pedagogical environment of TE programs (context-based programs Munoz-Izquierdo, 1994 in Tatto, 2008; type of providers context Davies et al., 2016; type of programs contexts Goldhaber, 2018). For Cochran-Smith and Fries (2009), the policy and politics can be identified as “shifting population patterns, major swings in the political pendulum, the growth of a complex global economy, and a number of educational and political movements [such as] the standards movement, the accountability movement, initiatives to privatize education and other public services, the press for market-based education reform, and the emergence of access to quality education as a civil rights issue” (p. 39). Another example is to consider the context in terms of new generations and new types of working demands (Mayer, 2006). A recent OECD study identifies implicitly the context with the factors affecting the governance of the teaching profession (Guerriero and Deligiannidi, 2017). In this case, some of these determinants have a larger societal character (e.g., teacher unions, the government and the administration) while others are rather field specific (inspection and standards, for instance).

An alternative way to conceptualize the context is the identification of “hierarchies, networks and markets”. The advantages of this approach is the possibility of combining policy and governance arrangements as well as political, economic and institutional cultures. Rhodes (1997) proposes three modes of governance: hierarchy, markets and networks, while arguing that network is becoming the dominant form within TE. Ball (2009) goes further and proposes a new way of approaching networks as “heterarchies”, referring to a mix of hierarchy, market and network to allow differentiated elements in the policy process that co-exist and co-operate. This concept links the economy, ideology and institutions to the actors and their agencies, both as individuals or policy elites.

An “interactive type of governance” (Torfing et al., 2012) in which networks play an increasingly important role is created by the contribution of many players and stakeholders in a social interactive arena. In this sense, the role of non-governmental actors, such as international organizations and think tanks, replacing bureaucrats and university researchers and scholars as educational experts is paramount (Han and Ye, 2017). The context of education and TE in particular is a renewed space formed by a plurality of social actors and their web of interactive networks.

The context is particularly relevant when adopting a comparative approach of TE in various countries or as single case studies that are oriented toward understanding the dynamics, configuration and outcomes of TE in various locations and is essentially

a sociological endeavor. The identification of the “context” of TE in one country, be it ITE or CPD, requires the selection of factors that can explain specific educational phenomena or institutional arrangements that are the object of the inquiry. In other words, “the context” is not a generic category that can include any macro-factor without distinction, however relevant for education in that country. The researcher contributes carefully to sketching the most pertinent context given the subject and the object of investigation, that is the focus and the theoretical issue at stake (Thomas, 2011). For instance, TE in the English case requires the elaboration of a specific context for which the neoliberal politics or the politics of the coalition or right-wing governments cannot adequately provide. In fact, a more pertinent selection of the relevant societal factors, beyond the type of approach, subject and methodology, may include the presence of hierarchies (inside school or as external accountability mechanisms, i.e., Ofsted), the presence of significant educational markets (in general and TE related), as well as of relevant institutional networks (teaching school alliances and other partnerships). Moreover, the investigation of a specific institutional aspect or pedagogical culture linked to TE entails the analysis of various contextual levels: the more immediate organizational level, the school system level, local or national government and even the global or transnational level.

The contextual dimensions and levels can vary according to number and type depending upon the perspective and approach undertaken. For instance, from the world-system or world culture perspective, the context is seen as an outcome of convergent forces and the school system exhibiting a similar *modus operandi* (Meyer and Ramirez, 2000). The theories that consider the political authority as influenced by a major ideology (e.g., nationalism, socialism), the school systems arrangements reflect the functioning of the State and its over-arching political philosophy. Other theories may consider other influential contextual forces that are not necessarily linked to the State authority.

This article is a review of previous and ongoing works while it also contributes to the advancement of theory on the role of the context and its conceptualization in TE. From a case study perspective (Thomas, 2011) the “subject” is the context of a form of TE, either ITE or CPD, while the “object” consists of the new theoretical elaboration of the context, in terms of the interactive governance of hierarchies, market, networks and the way their interplay shapes professionalism. Given the available space the cases are instrumental snapshots that serve to sketch TE arrangements in contexts with the purpose to illustrate theory building.

Theoretical framework: new forms of governance and professionalism

A major aspect to be considered when dealing with the “context” of education, and teacher education in particular, is the governance of the public systems that is actually reshaping and remodeling the traditional horizontal and vertical mechanisms of control, institutional partnering and competition. The State “steers at a distance” (Clarke et al., 2000) and recently it does so through new forms of governance, most often partnerships and networks, thus overcoming a traditional hierarchical model in the direction of a “polycentric governance in Western countries” (Ball and Exley, 2010, 151). In the same vein, Ehren et al. (2017) suggest that such configurations are to be seen as rather polycentric and therefore different from the more classical and monocentric forms, since decision making is now shared between the State and other institutional actors. The *partners* are, at the same time, deciding the rules and also ensuring they are respected via a complex system of interdependent relationships. Such governance tendencies have a deep impact on the stakeholders and can produce new institutional configurations and interactions in the field. In continuity with the previous New Public Management (NPM) phase (Theisens, 2016). New Public Governance is therefore characterized by horizontally organized social systems that can operate as networks. The governments—traditionally acting as hierarchies—can either enter to become part of such networks, monitoring the networks’ initiatives and decide the framework of their actions and collaboration from a distance, as well as facilitating the sharing of knowledge (Thompson, 2003).

As a key feature of current education contexts, networks are managerial forms that bring together various organizations such as public and private agencies and departments, in order to facilitate public action. In education this means that the responsibility pertains to the network and not to single institutions. As a case in point from the TE field, this trend is clearly visible in the creation of teaching school alliances in England, delivering both school-led alternative ITE and CPD. A second example comes from the dual partnering of universities and local regional authorities/academies in both ITE (INSPE) and CPD in France. In addition, in France the traditional hierarchical function of the school inspection has been transformed into a more supportive role for the teaching profession. Thereby, the network of professionals involved with CPD is composed of academics, local state representatives, inspectors and teachers as trainers.

Even in centralized countries where hierarchies are traditionally prominent, networks are becoming the key mechanisms of governance in the delivery of ITE and thus significantly transform the context of teacher preparation. Such recent policy transformation is backed by the premise that networks can be more significantly motivated by a desire for public service, compared to hierarchies (*bureaucracies*) or markets. Teachers and schools are placed in the “front line” of the education service, and this position would imply the possibility of securing access to valid and effective knowledge that can be more easily applied to specific situations, compared to the knowledge offered by those who are less well placed, such as within universities or training centers. Research conducted in England (Mincu and Davies, 2019) did not confirm the idea that networks of actors placed in the front line are morally superior when it comes to a public service motivation. The pressure exerted by markets and hierarchies on the training alliances involved with ITE might have influenced motivation. More autonomy does not immediately translate into a better service toward the public, even if the actors themselves may be genuinely convinced of this.

Recent reforms have strongly engaged with the context of TE and specifically with the forms of governance most appropriate to promoting a certain idea of teacher professionalism. In fact, different forms of governance of TE (both CPD and ITE) have

implications for teachers' capabilities, motivation and practice. Building on how providers shape new teachers' knowledge and professionalism, this article will add to the evidence base by presenting case studies of governance regimes in Europe and China. Given the cost of educating new teachers, it is unsurprising that there have been changes in the governance of ITE. At the same time, in some countries, CPD is traditionally a matter of partnerships between university, public centers or inspection services, private providers in free markets, schools and even teachers themselves.

NPM is a contextual factor that explains the specific institutional arrangements and types of professionalism. Even if NPM is a rather generic factor contextually, its impact is unequal and evolves in different directions in various countries. English governments have shown the most enthusiasm for NPM, experimenting with different forms of governance for ITE (.). Change in public sector governance in France has been described as a "decline in Napoleon's bureaucracy" and in Italy as deregulation. Despite being different cases historically, both France and Italy have introduced accountability measures into education, moving to a more organizational or "business like" teacher professionalism. A comparative review of the different trajectories in the UK, France and Italy should therefore yield valuable insights for research and policy. A previous analysis of NPM reforms has largely relied on idealizations of either a new configuration of governance through hierarchy and markets or an idealization of governance through professional networks. Chinese education is one sector of the public policy that has transformed from top-down state-directed into network governance (Han and Ye, 2017) clearly being influenced by the NPM model (Zhang and Bray, 2017). A pluralization of the public space in China implies that more ministries are cooperating or competing on various matters, that more matters are decided by the State council and not directly by the Party itself, more governance levels are involved (province and district, beyond the national), there is more institutional partnering in education and in the preparation of teachers.

The transformations of the context of TE, policy and governance first of all, but also the wider political and economic environment over the last decades has had huge implications for the model of teacher professionalism. A call to increased collaboration to "involve all key actors" (European Commission, 2012) in ITE recognizes that increasingly complex education systems are characterized by various levels of control and multiple stakeholders. A similar focus on strong partnership is at work in the recent policies of CPD in China (Liu, 2020).

At a theoretical level, teacher professionalism is a key outcome of the form of governance experienced and has been typically defined in relation to such macro-contextual factor (Evetts, 2009). I have summarized three of these definitions in Table 1. Hoyle (1974) vision of extended professionalism assumes that governance of ITE will be exercised through a professional network embedding public service values so that self-directed teachers will naturally serve the public good. His distinction between "extended" and "restricted" professionalism asserts that collaboration beyond the school influences new teachers' beliefs about relationships between knowledge and practice. Evetts (2009) account portrays managerial professionalism in the context of hierarchy and market governance through NPM. The depiction of collaborative professionalism (Whitty, 2008) adjusts the NPM model to include a requirement for teachers to be ready and able to collaborate with other professions when education is seen as part of social welfare. The fourth column summarizes definitions such as "occupational professionalism", "democratic professionalism" or "activist professionalism" (Sachs, 2001), which are considered as rather overlapping (see Mayer and Mills, 2021). Each definition is associated with a perspective on (1) the knowledge that teachers need (2) the values that will direct teacher activity in the absence of external constraints and incentives (3) the degree to which they should exercise self-direction in their work and (4) the role that collaboration should play in their work. Gaps in the table have been left where reading of previous literature has left the stance on this point unclear.

Each column in Table 1 presents a view of teacher professionalism with specific implications for the status of teaching as a career, the role that teachers are expected to play in forming societies and the independence that the teaching profession will enjoy. The first row invites investigation of the relationships between governance and new teachers' epistemological beliefs (Sing Chai et al., 2009). In particular, where they look for sources of "expertise". The second row invites an investigation of (new) teacher values orientation. Are new teacher values stable (as implied by research on values' orientation, indicating this issue can only be addressed at recruitment)? What qualitative differences can be identified in new teachers' self-direction? (Oosterheert et al., 2002) and to what extent does new teachers' capacity for self-direction change during ITE? What kinds of collaboration do new teachers believe are

Table 1 Forms that professionalism may take: networks of professionals/governments/agencies.

	<i>Extended professionalism</i>	<i>Managerial professionalism (NPM responding to the public choice critique)</i>	<i>Collaborative professionalism (variant of NPM)</i>	<i>Occupational/activist/democratic professionalism</i>
Knowledge	Professional judgment/application of disciplinary (HE-led) knowledge	Government defined standards for practice	Education as a strand within social welfare	Professional judgment/research-based oriented
Values assumed	Public service motivation required	Self-interest	Public service motivation	Public service motivation
Self-direction	Complex work requires capacity for self-direction	Adherence to best procedures	Adherence to best procedures	Autonomy
Collaboration	Between teachers and between teachers and academics to improve practice	Contrived collegiality	Multi-agency work for public service	Collegial authority

Fig. 1 The context, the nature of ITE/CPD providers and conceptual resources.

worthwhile and how does ITE influence their practice in, and beliefs about, collaboration (Musset, 2010)? Do the forms of collaboration in providing ITE/CPD play any role in forming (new) teachers' ideas about collaboration in teaching (Grimaldi, 2011)?

The nature of the providers and their institutional dynamics mediates the types of knowledge integrated into the teachers' theories of practice (Timperley et al., 2007) which are particularly relevant to inform effective teaching. The way professionalism is represented and produced, how (new) teachers' learning is approached and professional knowledge is developed are all intertwined. As showed in Fig. 1, conceptual resources are mediated by the nature of the ITE and CPD providers. The larger context of hierarchies, markets and networks is key to understanding professionalism and the way it is shaped by specific institutions. Knowledge can emerge, mainly but not exclusively, as inside/outside practitioner research through inquiry (Cochran-Smith and Lytle, 2009) or as academic research that is usually mobilized from outside (when HEIs or other expert institutions are ITE or CPD providers) or through the school system. Knowledge can also be mediated and shared by a network of private providers and trainers in a free market.

Methodological note

This article draws on teacher education scholarship, comparative education studies and education policy field. The cases exemplify the context of teacher education in countries that are different from this point of view. From a welfare state perspective (Esping-Andersen, 1990; Ferrera, 1996), all countries belong to different types—Southern European (Italy), Conservative-corporatist (France), liberal (England), a combination of social democracy, liberal and conservative-corporatist (China). From a governance perspective (Windzio et al., 2005), the types are as follows: East-Asian (China), Anglo-Saxon and Eastern European (England), State based (France) and South European (Italy). A diversity of contextual arrangements allows for theory illustration. A renewed way to interpret the context in teacher education is also functional to a new way to interpret and typify professionalism as main outcome of contextual variation. At the same time, the authors draw on data collected in these countries and further elaborate a conceptual approach to context initially developed by Mincu and Davies (2019).

School networks for ITE in England

Since 2010, education policy in England shifted ITE toward a "school-led" system with an emphasis on an apprenticeship model. The term "school-led" draws attention to the locus of decision-making in schools rather than higher education (HE). A HE-led ITE system may involve substantial "school-based" experience (or "practicum") for future teachers. What has changed in this school-led system is the way that the ITE is governed: who has control of how it is provided and how this control is exercised. The post-2010 system has favored governance through networks of schools. While the apparatus of hierarchical control has remained, the focus of the narrative in England since 2010 has shifted to giving control to local networks of schools (Mutton et al., 2017). This policy change was justified by a claim that schools rather than HE held the powerful knowledge necessary for future teachers (Gove, 2010).

The narrative trusts that governments can use contracting to reconcile a desire to exert hierarchical control with a devolution of governance to local school networks. In a contracting model the government delegates responsibility for provision to "for-profit" or "not-for-profit" organizations that are required to deliver contractual outcomes in return for payments from government. The

English government concluded that it was not able to make the ITE system work through contracts with HEIs, but does believe it can work with schools. This is consistent with a simple transfer of market thinking to teacher education: **powerful knowledge about teaching is generated by competing providers.**

Advocacy of school networks in England (e.g., Hill, 2011; Matthews and Berwick, 2013) has claimed that these networks will be motivated by a “moral imperative” in the public interest. This belief directly contradicts the assumption of self-interest that has driven NPM and the contracting model. It also overlooks the way in which the contracting model has opened the provision of schooling and teacher education to individuals, organizations and networks whose experience, beliefs and practices are rooted in fields beyond education (Ball and Junemann, 2012; Zeichner and Pena-Sandoval, 2015; Ellis et al., 2019).

Opportunities for groups of schools to form a partnership for teacher training in England were created in the early 1990s. These partnerships provided “School Centered Initial Teacher Training” (SCITTs) a school-based, employment route to qualified teacher status, the Graduate Teachers’ Program (GTP) introduced in 1998. Individuals recruited on this route received a salary from the school (heavily subsidized by the government) during their training, prior to certification. This scheme grew more rapidly than the SCITT program and by 2005, employment-based routes into teaching accounted for roughly a fifth of all ITT places in England and Wales (Smith and McLay, 2007). A pivotal moment in England arrived with the election of a coalition government in 2010 and a Secretary of State for Education who was committed to school networks and an apprenticeship model for ITT (Gove, 2010). The idea of “Teaching schools” as beacons of good practice located the apprenticeship model in institutions rather than individual mentors. Teaching schools would act as leaders of school networks, which became known as “Teaching School Alliances” (TSAs).

In 2012/13 the government introduced a new route into teaching referred to as “School Direct”. This program intended to shift the leadership of ITT from universities to schools to a much greater extent than had been achieved through the SCITT schemes. The establishment and growth of TSAs provided a realistic platform for achieving this objective and within 2-years, School Direct accounted for 30% of all ITT recruitment (Davies et al., 2016). This case study has portrayed a micro-network of schools that has achieved sustained success in the context of these struggles (as indicated by stable membership of the network, outstanding rating in government inspections of teacher education, and securing new contracts for ITE). And yet it does not seem to epitomize **the vision of an empowered local school network that has been depicted by policy (Gove, 2010).** The network was **driven by the need to adhere to government standards and to secure praise from government inspectors.**

In a study by Mincu and Davies (2019) the role of the contexts has been observed, particularly the impact of hierarchical and market governance. In fact, school networks are the favored providers of ITE in England in a “school-led” system. The evidence from participant observations and interviews conducted over a 5-month period has been analyzed as strategic intent and an enactment of a School Direct program. The policy of “school-led” ITE has been directed by statements suggesting that governance will operate through local networks. Some consequences of such arrangements could be observed in terms of the theoretical and evidence bases for the teaching practices of future teachers, the relevance of hierarchies and centralized knowledge for the teaching profession in spite of expectations for more localized forms of knowledge, their enculturation in certain organizational norms and the possibility of serving society.

Local hierarchies and the market of employers in the French ITE

For education in France, control lies strongly with the government. Nevertheless, the regional level *académie* has increasingly become a key player in an emerging “territorial governance” despite being “unofficial and not recognized” (Bouvier, 2012). This is particularly evident in ITE governance, where employers and networks of school professionals jointly direct university programs that exhibit many aspects of the English-style alternative/employment route. In fact, the context for public services in France has changed with the nature of the state which now plays a strategic and regulative role, distinguishing between commissions, operations and evaluation and with a significant portion of these functions being externalized.

A new territorial model based on networks is also very present in the public services domain in France, even if that is less visible and more incipient in education (Bouvier, 2012). These new realities run parallel to a hierarchical mode of governance based on “circulaires”/ministry decrees to the schools or the lower territorial levels. Decentralization went through a process of “territorialization” (Act 2004, see Bouvier, 2012, p. 67) that means an adaptation of the politics to respond to the specific needs of local communities. The territorial dimension of education is very complex with each territorial unit having a specific educational competence. The two main levels are the regions and the “departments”; while the first may promote more decentralization, the latter, given their longer history, operate more on a centralization model at the lower level. The three main decision-making levels in education are: central government, the academies and schools. “The *académie* has become the main place for regulation and coherent implementation of the education program” (Solau in Bouvier, 2012, p. 234).

The lower territorial level (*académies*) entertains a contractual relationship with the central ministerial office, based on an educational project and 4 strategic fields, following a logic of local strategic management (*project stratégique*) with the aim of transiting toward a results-based type of public management. The application of a contractual logic to the relationship between the State and the academies has been gradually initiated since 1998. A more hierarchical and bureaucratic State has been transformed into one more polycentric (Bouvier, 2012), also on the input of internationalization trends of what means being a professional (Wenzel, 2015; Malet, 2015). As suggested by Malet and Mincu (2018), at the territorial level the State acts not just as employer (*l’État-employeur*), but mostly as a State charged with the training (*l’État-formateur*) and it does so through local institutional networks and partnerships between local education authorities (*académies*), universities and schools.

The ITE system was radically transformed on the creation of the *Instituts Universitaires de Formation des Maîtres* IUFM (1990); institutions outside university system training that offer same level preparation to both primary and secondary teachers. Since 2005 there has been a trend of incorporation at master's level and integration into the university, a subsequent creation (2013) of the *École Supérieure du Professorat et de l'Éducation* (ESPE) aiming to combine academic preparation focused on practice with increased professionalization. The most recent reform (2019) was implemented with the *Institut National Supérieure du Professorat et de l'Éducation* (INSPE). Based on a 2-year training model inherited from the IUFM, the ESPE (now INSPE) training occurs in 2 phases: a first year of preparation toward the national recruitment competition, followed by pedagogical preparation. Following this, a second year leading to the master's degree. During the second year, students are paid as trainee teachers (and they have to teach part-time in a school). The global scheme is quite similar to that of the IUFM: after 3 years at university, students enter an ESPE and undergo 2 years of training. A reference table of teacher competences and a national curriculum framework for the ITE in ESPE serve as accountability systems that reinforce the professionalization side. Such training schools emphasize the role of research as well as the internationalization component, while also being tied to a university study path linked to the world of professions. It configures as a professional master's, different from other research master's options and striving to strike the right balance (Esterle, 2017).

The interesting aspect in terms of relevance in the context of ITE is the creation of an institutional arena where a variety of professionals and local representatives can jointly decide on the type of training. The INSPE council is made up of university representatives and external personalities representing the territory (at least 30%), while the president is named by the rector of the local *académie*, which is the employer in this case. An administrative council is chaired by the school director who is now directly nominated jointly by the higher education and the national education ministries. Half of the scientific council of the school includes external personalities. Consequently, the contribution of “territorial governance” and the local network of school inspectors, trainers and experts is fully recognized in the administration of this school that is incorporated into the university. The fragmentation of its internal cultures has been a limitation and has been opposed since its inception for its clear efforts to link the various contributions to the preparation of new teachers, such as “sandwich training, linking theory and practice very strongly” (Cornu, 2015, p. 304). A tradition of practice analysis seminars, as well as other initiatives were in place to link the more general pedagogical preparation (*trunc commun*) to teaching practice in schools. A significant percentage of the staff includes lecturers with many years of school experience, who are temporarily detached and contribute to the delivery of the training modules between theory and practice. Nevertheless, university based staff remains rather disconnected to the actual practice of trainees in schools (Cornu, 2015).

Specialized networks of professionals in ITE for primary school teachers in Italy

The incorporation of higher education for primary teacher preparation has been consolidated over the last 18 years. Fully integrated university courses—called “educational sciences for primary teaching” (*scienze della formazione primaria*)—have been established in more than 30 universities throughout the peninsula. Admissions numbers are established centrally by the ministry itself, based on a forecast of the need for new teachers in the 20 Italian regions. As a consequence of the Bologna process of the structural harmonization of higher education paths in the European Union, since 2010 the program has followed a unique model which includes 3 years at undergraduate level, plus 2 years of postgraduate studies.

Italian governance is built on a hybrid of devolution and centralized bureaucracy and the centralization model has been considered similar to a “harlequin type”, with significant margins of diversification (Semeraro, 1998). In fact, financial devolution implies a strong state, a weaker market, and a significant contribution from the community, especially from parents. At a justificatory level, Italian trends toward devolution and education markets, as key components of deregulation are in line with a global “disillusionment with the national modernization programs of the post-war period” and a “loss of legitimacy of the welfare state in general” (Whitty et al., 1998, 132).

Although deregulation appears to be weaker in coordinated market economies, such as Italy, in comparison with liberal market economies (Hall and Soskicze, 2001), it nevertheless triggers greater inequality in education. From the 1990s onwards, a deregulation phase brought major school autonomy reform. Influential Catholic groups endorsed liberal and neo-liberal arguments and allowed more involvement of local communities and families (Semeraro, 1998). Unquestionably, a clear hallmark of a renewed institutional context is the sweeping federalization reform, under way since 2001, with a change to the Fundamental Law (*The Fifth Title*). Linked to this, the school autonomy reform of 1997, various neoliberal initiatives, and recent fiscal federalization in education are concrete steps toward partial deregulation. The federalization of education (Bordignon and Fontana, 2010) as a process of financial and institutional decentralization at the regional level has been silently ongoing—through inaction—but as an intentional process, after years of indecision and lack of public debate (Mincu, 2015).

NPM in education has been visible since the newly established accountability system in 2011 (Law no. 10) of a National Evaluation System which aims to help schools monitor the efficiency and efficacy indicators of their educational offerings and undertake improvement in an autonomous manner; to provide school administration with useful information (Freddano and Pastore, 2020; Fiore et al., 2017) to promote cultural, social and economic growth and to introduce the evaluation of head teachers. In addition, and as a consequence of a developing accountability culture, the Good School Law introduced internal teacher assessment and the concept of performance-based pay (Mincu, 2019). The head teacher evaluates teachers and rewards them according to criteria set by each school for the first 3 years of the performance-based pay policy and thereafter on centrally agreed indicators. All schools are required to develop a self-evaluation report and a school improvement plan, as well as to

measure and assess overall performance of the administration itself, its offices and employees, with reward systems for the best performers (Law 150/2008).

In primary and pre-primary preparation at university level, an emerging accountability system of teacher education is rather formal and quantitative in nature: it specifies the number of credits, the types of areas to be covered and levels of staffing resources. In the absence of teaching standards, it does not regulate the content of teacher education but merely provides orientation toward competences that are locally identified by each primary school-teacher program. The 5-year bachelor's and master's level courses are closely affiliated to educational sciences courses and reflect an academic tradition in teaching and learning.

Teacher preparation is university-led with 300 h of practical experience during the 5-year program in schools. Trainees have the opportunity to undertake "indirect" *practicum* (lesson observation) or "direct" *practicum* (lesson delivery), but they are never fully responsible for a class during their training. Their practical preparation over the 5 years is strong on the academic side (educational sciences applied to the teaching profession) but weak on the number of subjects to be covered on all the 5 school years they are required to teach. Three types of training figures are responsible for their preparation: the university professors (who are on a full academic track and do not possess direct knowledge of the school world), contract university professors (temporary academic professionals, some with school experience) in charge of workshops and university tutors (teachers working temporarily for the university) in charge of their practical experience and responsible for a group of students, for or periodical meetings at the university and school visits. A fourth figure is the assigned teacher inside the school of practice, who agrees to be a local supervisor.

Collaboration between the university-based professionals is rather weak. The contract professors charged with the workshops that are selected by the university professors themselves and the curricular offer can be jointly agreed. The profile of the knowledge offered is theory-oriented, and research-based with little input from the practice in schools. The curricular autonomy is wide either for courses or for workshops, since the offer is weakly oriented toward a list of teacher competences. Agreed standards for the teaching profession are not as yet in place. The links with the university tutors (former school teachers) are rather casual. **The contribution of the four networks of professionals is delivered in separation rather than collaboration. The networks work inside a shared culture that is derived from their professional profile and duties, but there are no formal opportunities to share their practices and understandings. The university environment is largely based on academic autonomy, which is the main criteria to decide and deliver the curriculum and then to assess the students' progress.** However, the team of university tutors is an exception. They are usually coordinated by a lead tutor, and the tutoring office decides on common criteria of action. Nevertheless, the tutors are trained within a similarly very strong culture of teacher autonomy inside schools and so their practices may be weakly aligned when acting in their tutorship role.

To sum up, the preparation of the new teachers at this level is not influenced by market forces, since the admission numbers and procedures are centrally established. The school and the university hierarchies are rather weak, since accountability mechanisms are very new devices. One major type of contextual force is clearly visible: the specialized networks of professionals operating with wide margins of individual autonomy and weak coordination inside and between such networks. It has to be mentioned that the preparation of secondary school teachers is highly unstable and therefore the overall picture of the Italian TE leads to fragmented professionalism (Mincu, 2018).

Multilevel hierarchies and institutional networks in Chinese CPD

As showed by Han and Ye (2017), Chinese education policy-making has changed significantly over recent decades: from Party-dominant to primarily driven by central government, an enhanced role for higher education institutions (HEIs), scholars as "professional interest group" and the inclusion of non-governmental actors in the policy-making process. The transition from a highly hierarchical model of governance to one that is more inclusive and diversified with the presence of networks has evolved in 4 phases: (1) pre-1978: top-down state-directed (2) 1978–1987: transition from state-directed to policy community (3) 1988 to 1997: the evolution of a policy community (4) 1998–2010: the emergence of issue networks (Han and Ye, 2017). At the same time, in-service teacher education in China has undergone 4 phases of substantial transformation: (1) "recovery and reconstruction", (2) "reform and expansion", (3) "comprehensive transformation" (4) "coordinated development" (Liu, 2020).

Over the last 20 years the context for CPD has changed through a series of policy measures; mainly the expansion of teacher education by institutional diversification and structural changes through upgrading, merging and closing institutions and schools. At the same time, considerable efforts have been put into the innovations in the modes of teacher preparation, curricula and teaching practicum. The "transformation" of in-service teacher education has implied 3 types of transition: (1) academic compensation education to continuing education (2) normal teacher education in a diversity of institutions (3) a separate TE to integrate pre-service and in-service teaching.

The methods toward improving the quality of training has changed over time. After the introduction of the new curriculum in 2001, the Ministry of Education provided top-down mandated training for all teachers on the new curriculum. Hence, a cascade model was adopted (Paine and Fang, 2006), in which the central and provincial governments ran national and provincial programs for teacher trainers, in order to train other teachers across the country (Zhou, 2014). Training activities included listening to the introduction of government policy and regulations and lectures provided by outside experts, in which the content was theoretical

or even abstract without any practical application (Feng, 2003). As Zhou (2014) says “training was regarded as ‘telling’ so teacher learning was considered as ‘being told’ and the teachers were not empowered” (p. 511).

With the launch of the “National Training Program” CPD has entered a new phase of “cooperative development” right from the top, down. *The Teacher Education Revitalization Action Plan* (2018–2022) was issued by the Ministry of Education, the National Development and Reform Commission, the Ministry of Finance, the Ministry of Human Resources and Social Security, and the Central Organization. This policy document asked to innovate the teacher training model and establish a new mechanism for the joint training of teachers between higher education institutions, local governments, primary and secondary schools (kindergartens, vocational schools). The *Teacher Education Revitalization Action Plan* (2018–2022) further emphasizes the importance of building a collaborative teacher education system, based on normal universities, high-level comprehensive universities, teacher development institutions, and high-quality primary and secondary schools (Liu, 2020).

In recent years, various projects have all embodied the concept of **collaborative development** of teachers, such as “sending to the countryside”, “backbone teacher studio”, “teach and research in joint school district”, “online and offline mixed training” and “master of education”. Such new forms of teacher education have sprouted mostly in urban centers. For example, teachers can dispose of “learning communities” that are organized in school alliances, while designated “master-teachers” organize their own “master work studios” to train future teachers (Zheng et al., 2019). This new collaborative model was preceded in the early 80s by a “three components communication” model of learning promoted by the Open University, the Evening University and centered on adult self-study. This has developed into network training and mixed learning modalities. Other forms of collaboration include **urban—rural partnerships** to improve the quality of education. From the mid-1980s, education lecturers supported education and training in remote mountain villages. A learning community of urban and rural teachers has been built around the idea of partnership: senior students are sent to schools in rural areas for one semester to replace selected school teachers who then go to the colleges for training. Other forms of partnerships that changed the CPD landscapes are built around **University–Government–School partnership**, such as in one initiated by the Northeast Normal University (Jilin Province) in 2007.

These changes aim to “flexibly open up” the system of TE through diversification of its course providers. It also aims to foster competition in a system that was unable to satisfy the educational demands of an emergent knowledge economy. At the same time, the TE scenario has been changed using **accountability measures**, such as the introduction of standards in TE and the inspection of providers. New notions of professionalism are visible in the Teacher Education Curriculum Standards, that promoted learner-centered, practice-oriented and lifelong teacher learning.

Looking into the relationship between hierarchies, markets and networks, the Chinese situation is particularly complex. First, the arrangement of the central power administration is dual-faceted, given the coexistence of the Party and the government, with the latter holding the reins of power in education policy making. (Han and Ye, 2017). At the same time, even if the dominant decision-making power rests ultimately in the hands of the State, the wider context has greatly changed over time. The government cooperates with professional academic groups when undergoing reform (Han and Ye, 2017) and the wider public can be, at times, even be greatly involved, as was the case with *The outline of China’s national plan for medium and long-term education reform and development (2010–2020)*.

In China, there is a trend of power fragmentation and diversification that coexists with an **elite hierarchical power structure**. The unprecedented degree of public participation in policy matters has made education less of a political issue, and more a social concern that requires the support of scientific research.

Discussion and conclusion

The focus of this comparison is the role of the context in various types of training and its relationship to various professionalism aspects. As illustrative examples this article has considered, alternative routes in England, a HE-led model of ITE in France based on partnership with the territorial system/employer, a primary school ITE path that is HE-led in Italy, as well as the complex collaboration inside and outside hierarchies in China to deliver CPD.

One major driving force in all contexts is the NPM in education even if that assumes various manifestations and combinations of the three contextual mechanisms. While the contracting out mechanisms of the State are more visible in England and France, the “State controlling at a distance” model through accountability mechanisms is the preferred way in both China and Italy; the Italian ITE being rather autonomous and HE led, with more formal accountability mechanisms in place (see Mincu, 2019).

An inter-disciplinary “interactive governance” perspective recognizes the interactions of governance through hierarchy, markets and networks, while being sensitive to the problems and solutions offered by each combination. Advocacy of network governance for ITE in England (e.g., Hill, 2011; Matthews and Berwick, 2013) has neglected the implications of pressures from hierarchical governance (from central government) and market governance (through the supply of teachers and competition with other schools). Successive policy shifts in England have encouraged network governance within the context of market governance while also retaining hierarchical governance by government. Interactions between these varying forms of governance are inevitable. But when policy ignores these interactions it is bound to create problems. However valiant and well-intentioned schools may be, they are being asked to deal with a set of contradictory pressures. In more polycentric systems there can be various “hierarchical

arrangements” in mixed network form and this seems to be the case with the new territorial governance in France, more generally speaking, and in particular in the area of teacher preparation. The relevance of local representatives on the various committees is indicative of a model of strong networks inside hierarchies. The Italian case of primary ITE is rather singular in its simplicity. In the Italian case, networks of professionals deliver highly academic training. The Ministry guidelines about the contents are rather loose and not informed by professional teaching standards. These refer mainly to the time to be assigned to courses, workshops and practicum and roughly indicates the academic research areas that can contribute in full local autonomy. A HE hierarchy leads this model. The Chinese context of CPD is characterized by strong hierarchies that are adopting a network logic with the academic world and widely privileges partnerships and diversification.

Which profile takes the interactive governance model of the contextual forces in the four countries? Describing the context in terms of types of governance and relationship to professionalism does not have any implications on the quality of the TE. In addition, the characterization of various public systems can be very different and the situation of education can be in line with what happens in other areas or a singularity, a case per se. This can be said about China’s more networked governance, in spite of a more general hierarchical pattern. In France the transformation of the state is rather diffused but somehow unrecognized, because the current discourse continues to emphasize traditional centralization under strong State control.

England is the clearest case in point for very strong networks as major contextual factor. These manifest in solid relationships with hierarchies at school level and system level (notably with the Office for Standards in Education—Ofsted), in a market oriented ITE model, in a country with a wide diversification of training routes and clear preferences for employment-based routes. France draws upon a local partnership between HE and academies and a more territorial hierarchy that is active in its role as employer of teachers. Networks of professionals manifest themselves inside the training institutions. The tensions in France are a sign of a more successful opening up of the academic world to the school networks of professionals compared to Italy. French universities propose a short route model and privilege a hands-on and a “teaching in responsibility” model, much more similar to the employment based-routes in England. The Italian ITE shows that only HE hierarchies can have a say and the network of academics inside it are key players. HE has led teacher training on a very autonomous model path, in a context in which hierarchies and accountability mechanisms are weak and the market logic irrelevant, since numbers are centrally determined, as are the providers. China’s CPD displays collaboration between multi-level hierarchies, schools included. The central authorities are key players but the model overall has been pluralized and diversified from top to bottom with an extension of the partnerships between urban and rural areas of the country.

But what is the relevance of the context and how does it contribute to teacher professionalism in the four cases? A first consideration is that assessing this link does not imply any judgment about the quality of the training. The proposed model of professionalism as promoted by the context identified 4 models and 4 dimension (see [Table 2](#)). The fourth model represents rather an ideal type. Each country may exemplify some of its dimensions but no one can typify it. The English case of ITE appears as a perfect case of managerial professionalism across all the 4 dimensions with a transition toward more collaboration (as inter-agency). More generally, China moves from a universal and state welfare model to one which is market-based ([Guo et al., 2013](#)). At the same time, its definitively collaborative type of professionalism is rather mandated ([Ke et al., 2019](#)). Thus, this case represents a partial collaborative professionalism model across the three dimensions with a mix of managerial when it comes to collaboration, which sometimes appears as rather contrived. The French case is a mix of HE-led model as in extended professionalism but low teacher collaboration nevertheless, and relevant accountability as standards oriented TE. The importance of employment and the relevance of the territorial level renders it as a rather imperfect model of managerialism. The Italian case of primary teacher ITE is a partially extended professionalism model, because of the lack of collaboration inside schools and its strongly HE leadership.

This analysis helps to associate the various types of professionalisms with governance combinations, drawing on the empirical evidence provided derived from four country-cases. The ideal types of professionalism can be characterized in terms of governance as indicated in [Table 2](#). Then, it is possible to note how the ITE and CPD contexts, in relation to the type of professionalism, can be further interpreted at the interplay of knowledge, values, self-direction and collaboration.

Table 2 Forms of professionalism and contextual arrangements in 4 countries.

	<i>Extended professionalism HE hierarchies Networks within schools</i>	<i>Managerial professionalism (NPM responding to the public choice critique) markets, school/system hierarchies</i>	<i>Collaborative professionalism (variant of NPM) Networks between institutions & professionals</i>	<i>Occupational/activist/democratic professionalism</i>
Knowledge	Italy, France	France, England	China	England, China
Values assumed	Italy	England	China, France	Italy
Self-direction	Italy	France	China	Italy, France
Collaboration		China, England	China, England	England

Introduction

This chapter arises from an in-depth case study of the way in which initial teacher education (ITE) partnership working has evolved in light of significant reforms to teacher education policy over the past decade in England. The case study focuses on a specific school (Waterside Academy – a pseudonym) that works within a well-established university-school partnership, yet which has, at the same time, become a government-accredited SCITT provider in its own right. SCITT (School-Centred Initial Teacher Training) providers offer postgraduate teacher training programs that lead to Qualified Teacher Status (QTS) with some SCITT providers also linking with a university to offer a Postgraduate Certificate in Education (PGCE). The research from which the case study is drawn was used originally as the source material for a guide produced to inform teacher educators’ understanding of partnership working (Mutton et al., 2018). Writing from our own perspective as teacher educators within one of the earliest ITE partnership models in England – the Oxford Internship Scheme (Benton, 1990) – we here examine how policy change in the past decade, and enactment of that policy, have led to changes in the way that partnership has been conceptualized.

Working from the premise that the term “partnership”, in the context of ITE, is used “to carry certain theories about the nature of learning to become a teacher” (Brisard et al., 2005, p. 5), the chapter illustrates the way in which such theories encompass an understanding not just of what beginning teachers need to know and be able to do, but also of the processes by which their professional learning takes place (Burn et al., 2015). While the importance of partnership working has long been recognized in official government policy in England, many well-established partnerships between higher education institutions and schools could be characterized as essentially university-led (Furlong et al., 2000), with insufficient integration between the university-based and school-based parts of the program. Focusing on the processes by which beginning teachers develop the knowledge and skills that they require in order to become accomplished teachers, we highlight the way in which the potential lack of a shared understanding as to how these processes might best be enacted will inevitably lead to tensions – in relation both to the organizational aspects of partnership and to pedagogical concerns. We conclude by offering some key principles which, we suggest, might usefully inform the way in which ITE partnerships operate.

Policy background

The “school-led” policy drive in England, launched by the government White Paper “The Importance of Teaching” (DFE, 2010) and developed in subsequent policy documents (DFE, 2011a, 2011b) attempted to re-align the balance of power in teacher education by setting up structures to give schools more responsibility for the recruitment and training of new teachers. While the language used was still that of partnership, the assumptions that underpinned this drive were, however, clearly encapsulated in the Secretary of State’s conception of teaching as a “craft” (Gove, 2010). Such a conception underpinned the subsequent development of “School Direct” and the expansion of School-Centred Initial Teacher Training (SCITT) provision, essentially prioritizing an apprenticeship model of professional learning and has been the predominant influence on teacher education policy over the past ten years (for a

more detailed account of policy over this period see [Menter et al., 2019](#)). This policy drive has arguably made it extremely difficult for partnerships that rest on alternative epistemological and pedagogical underpinnings to maintain an approach that both respects and seeks to integrate the distinctive contributions of school- and university-based teacher educators. It could equally be argued, however, that an increasing emphasis on the role of school-based teacher education has, in fact, led to the development of more collaborative approaches to partnership working in England over the past decade, as schools engaged in the new School Direct models negotiated their relationship with university partners. Partnership working was seen to be at the heart of these reforms and the government gave a clear signal that it wanted to “encourage more universities to follow the example of the integrated working of the best university-school partnerships” (DFE, 2011a,b,c, p. 11). Integration is seen as being key to the new model in order to deal with the perceived problem of schools within traditional university-led partnerships ([Furlong et al., 2000](#)) being somewhat marginalized in terms of their contribution to the conceptualization, planning, delivery and evaluation of the individual ITE program. Partnership working was to emulate what were considered to be more collaborative models and, in order to ensure that partnerships responded in an appropriate way, the government indicated that it would ... also change the inspection of ITT so that the quality of partnership working is treated as more important. (DFE, 2011b: para. 15).

It should be noted that ITT (initial teacher training) and ITE (initial teacher education) are both used to describe the preservice period of teacher preparation. ITT is the term used by the government in England. We use the term ITE (preferred by many university providers) unless referring to government publications.

Understanding the nature of ITE partnerships

The question as to what constitutes quality in ITE partnerships is partly addressed through consideration of different models of partnership. The Modes of Teacher Education (MOTE) project ([Furlong et al., 1996, 2000](#)), carried out in two phases in order to study the impact of earlier government policies on models of teacher education in England at the time, identified three predominant models: collaborative partnership; HEI (Higher Education Institution) led partnership; and separatist (or complementary) partnership.

Collaborative partnerships embody a “commitment to develop a training program where students are exposed to different forms of educational knowledge, some of which come from school, some of which come from HE or elsewhere” ([Furlong et al., 1996](#), p. 44). At the time, ITE providers were predominantly within the Higher Education (HE) sector and the authors therefore identify how school-based and university-based colleagues might work together to plan and deliver the ITE curriculum in such a way as to enable student teachers to critique what they learn from both settings and are thereby able to “build up their own body of professional knowledge” (1996, p. 44).

The HEI-led model sees the school’s role as acting as a resource to provide learning opportunities for its student teachers within a university-designed ITE curriculum. Within the model there is a strong emphasis on quality assurance to ensure that student teachers receive comparable training opportunities.

The separatist, or complementary model is one “where school and HE are seen as having separate and complementary responsibilities but where there is no systematic attempt to bring these two dimensions into dialogue” (1996, p. 47). Program integration is not a necessary element within such a model and it is up to the individual student to achieve any such integration.

The MOTE researchers identified that any single ITE program might embody aspects of each model, leading to a “continuum of possible relationships” ([Furlong et al., 2000](#), p. 77), although they also found that the HEI-led model was predominant, in spite of frequent rhetoric referring to collaborative partnerships. All three models carry with them, however, some sense of partnership operating as an “epistemological and pedagogical concept” ([Furlong et al., 2008](#), p. 309); that is to say an acceptance that preservice teachers require access to different forms of knowledge which neither the university nor the school can exclusively provide ([Hagger and McIntyre, 2006](#)). It is, however, only within a truly collaborative model that full integration is likely to take place. While there is almost universal agreement that effective partnership working is the key to success of any ITE program, it also needs to be acknowledged that the “rhetorical power of partnership” ([Conroy et al., 2013](#), p. 558) can hide more general concerns about the way in which teacher education pedagogy plays out in practice across different teacher education settings.

Learning to teach within ITE partnerships and the role of clinical practice

Such concerns are not unique to the English ITE context, where there has been an emphasis on promoting not just quality but also quantity (that is to say, securing the engagement of enough schools as partners in ITE programs in order to maintain the supply of new entrants to the profession). Elsewhere, there has been an increasing trend toward more school experience within programs of preparation for preservice teachers, a trend often referred to as the “practicum turn in teacher education” ([Mattsson et al., 2011](#), p. 17). Underpinning such initiatives has been a need to address issues of integration, or coherence within programs, which [Hammerness \(2006\)](#) defines as “the alignment of key ideas and goals across coursework and clinical work” (2006, p. 1244). Internationally, partnership development has been a key feature of initiatives such as Professional Development Schools in the United States,

which identified as central to their success the need for coherence between the taught program at the university and the school (i.e., clinical) experience (Darling-Hammond, 2006). Similar clinical practice models, which emphasize integration through effective university-school partnerships, have been developed elsewhere internationally, for example in Australia (see McLean Davies et al., 2013 for details), in the Netherlands through the introduction of *academische opleidingsscholen* (Hammerness et al., 2012), and in Finland, through designated training schools (Sahlberg, 2012).

It needs to be understood, however, that the term “clinical practice” designates not only the school-based elements of any ITE program but also underpins a particular approach to teacher education partnership working within a clinical practice model. Alter and Cogshall (2009) summarize the characteristics of all clinical practice professions, including teaching, as being: the “centrality of the clients” (in this case, school pupils); a complex professional knowledge base; the use of evidence and judgment (rather than pure technical skill); a community of practice operating with shared standards; and “rigorous academic and practical training” (2009, p. 9). Beginning teachers need, therefore, to have access to appropriate learning opportunities that allow them to develop as full professionals within such a framework, in order to enable them both to hone the practical skills needed as a teacher but also to enable them “to engage in the creative processes of interpretation, intervention and evaluation, drawing on diverse sources of knowledge that include research evidence as well as student data” (Burn and Mutton, 2015, p. 219).

Returning to the policy landscape in England, there is some limited evidence to suggest that the increased involvement of schools in ITE programs as a result of the implementation of the 2010 government reforms has led to greater collaboration around program design and delivery (Universities UK, 2014). A study of the impact of “School Direct” in England (Brown et al., 2015) concludes, however, that the balance of power within partnership arrangements has altered and that “(t)he composition of trainee pedagogical experience is being reconfigured” (2015, p. 23) because of differing beliefs about the nature of the learning experiences that beginning teachers may need. The authors of the report argue that the reforms have not led to greater levels of integration within ITE partnerships but have, instead, resulted in a situation where:

trainees were having to assimilate quite different understandings of pedagogy between school-based and university-based training sessions whilst efforts to mesh what was being taught within each setting was often limited. It was not uncommon for trainees to feel that content had been repeated by the school and/or university. (2015, p. 23).

There are clearly challenges to ITE partnership working within the current policy context in England but many of these challenges are not new. Almost 40 years ago, immediately prior to a previous significant wave of teacher education reform in England, Alexander (1984) was warning that the “comfortable language of partnership” that policy-makers and others so easily use, could conceal “more intractable issues” (1984, p. 142).

Challenges inherent within partnership working

From our experience as teacher educators and drawing on what research tells us, we have tried to identify what these “intractable issues” might be – both in relation to partnership working generally and, more specifically, in light of the current ITE policy context in England. We identify four such challenges:

Partners may not necessarily share the same conceptualization of what constitutes effective teacher preparation

It cannot be assumed that there will necessarily be shared understandings within an ITE partnership in terms of either the knowledge base that beginning teachers require, or the learning processes by which they acquire professional knowledge and skills to enable them to teach effectively, or both. Within what might be seen as more traditional programs there has always been the likelihood of a potential “disconnect between the campus and school-based components of programs” (Zeichner, 2010, p. 89). The introduction of “School Direct” has required schools in England to take a more dominant role in partnership working, but may not have reduced such a “disconnect” since it does not necessarily guarantee agreement between partners as to the most effective way of preparing new teachers, nor led to greater innovation within partnership working. What it has done, however, is place more emphasis on the “practical components” of ITE programs and less emphasis on “theory and analysis” (Brown et al., 2015, p. 5).

There is also an argument that effective ITE needs an agreement between partners first as to what constitutes good teaching and then, in turn, how to prepare beginning teachers to teach in this way. Where there is no “common, clear vision of good teaching that permeates all coursework and clinical experiences, creating a coherent set of learning experiences” (Darling-Hammond, 2014, p. 548) then program goals risk being compromised (Bartholomew and Sandholtz, 2009) and teacher learning fragmented (Taylor, 2008).

The evidence from our case-study of Waterside Academy would suggest that there is a high level of consistency of views within the SCITT program as to what constitutes effective ITE. The ethos underpinning the program is pragmatic and reflects the program goals of producing teachers who will work in the specific local contexts in which they train. There is agreement among those working on the program that it needs to develop independence, resilience, initiative and a sense of realism in the teachers it is training. For

those working at the same school within the university PGCE partnership there is, however, more evidence of a disconnect between the program goals and the views of the school-based teacher educators. Those goals are focused not only on developing the beginning teachers' classroom competence but also on developing their capacity to evaluate their own teaching critically. As part of this evaluation they need to be able to recognize the provisional nature of the suggestions for practice that they're offered and also appreciate that these may be open to critique and challenge in relation to different criteria. The PGCE program aims to equip them not only with the skills they need to teach but also with the capacity to go on learning as professionals by taking increased responsibility for identifying and meeting their own developing professional needs. While acknowledging the need for beginning teachers to draw on a range of sources (both theoretical and practical) to inform their developing thinking and practice, there is nevertheless a sympathy among school-based colleagues who work within the university PGCE partnership with the approach taken by the SCITT, which they see as being more focused on immediate classroom-based experience. The evidence suggests that new "school-led" models of partnership may have greater levels of internal coherence, but that such coherence is premised predominantly on a craft model of teaching, reflecting Brown et al's (2015) conclusions that practical-based training is privileged over theory and analysis.

Finally, we would argue that ITE programs need to offer more than just a model of reflective practice. Beginning teachers need to be offered "suggestions for practice", including those based on theory and research as well as those put forward by experienced school-based colleagues, but all such suggestions need to be subject to critical reflection (McIntyre, 1995). Although many teachers might justifiably endorse the value of reflective practice, McIntyre argued that this was not, in itself, sufficient as a model for beginning teachers' learning since the latter need to evaluate *critically* all suggestions for practice that they receive, and need to do so against criteria that are informed by both practice and research. While it is expected that all ITE programs will encourage beginning teachers to be reflective, the focus of this reflection needs, at some point, to go beyond a "technical" level (Carr and Kemmis, 1986) and, we would argue, needs to develop their capacity to identify and resolve issues in their teaching; to evaluate effectively the outcomes of innovations to their practice using appropriate criteria for such evaluation; and to consider the impact of their teaching in relation to wider societal issues and policy contexts.

There may be tensions between the differing goals of preparing a teacher to be "school-ready" or "profession-ready"

One effect of the ITE reforms in England has been that schools are able to work either with school-centred providers (i.e., SCITTs) or with university providers, either within a School Direct model or a traditional partnership model. Unsurprisingly, the opportunity to continue to work with ITE providers while at the same time having greater autonomy in determining the nature of the training program has been popular, particularly when the School Direct model is premised on beginning teachers securing employment in the partnership schools in which they train. This can, however, lead to tensions.

If the purpose of the ITE program is seen as being to prepare teachers to work in a specific context, then the focus is likely to be on the need to induct teachers quickly into the practices of that particular setting. Of a lesser priority, perhaps, will be the development of teachers' capacities to be able to adapt when faced with a different context or a new set of curriculum demands. While all beginning teachers need to learn how to work efficiently and effectively, they also need to develop the capacity to adapt and to "move beyond existing routines ... to rethink key ideas (and) practices" (Hammerness et al., 2005, pp. 358–359). Furthermore, they also need to develop the "capacity for critical engagement with suggested innovations in classroom practice" (Hagger and McIntyre, 2006, p. 37). Partnerships need, therefore, to do more than just ensure that beginning teachers are "classroom ready"; they need to provide the learning opportunities which support these teachers in developing not only their capacity for innovation but also the appropriate criteria (both academic and practical) by which innovations in their teaching can be evaluated. Otherwise the risk is that the beginning teacher is only ever expected to deliver the school curriculum in a specified way; what Edwards and Protheroe (2004) refer to as "teaching by proxy" (2004, p. 183). McIntyre (2009) also highlights this risk, arguing against partnership models which are "aimed only at preparing beginning teachers for the status quo, and very deliberately being planned to avoid them being encouraged to think critically of that status quo" (2009, p. 603).

At Waterside Academy the SCITT program is, as noted above, focused on preparing teachers to work within a specific context and success is measured by their capacity, as one mentor put it, to "fit in", having been "nurtured and fostered" by the school. Teachers working within the program explicitly stated that it is unhelpful for trainee teachers to want to introduce innovative methods into their teaching. Therefore, within the SCITT program, there are few apparent tensions around the implementation of the program goals and the way in which training leads to these goals being realized, and little acknowledgment of the need for teachers (and new entrants to the profession in particular) to develop what might be called "adaptive expertise" (Berliner, 2001). While those involved in the program have confidence that the teachers will be well prepared to work in partnership schools, there needs also to be an awareness of the limitations of an approach which carries the potential risks identified by both McIntyre (2009) and Edwards and Protheroe (2004).

Partners have differing priorities and differing levels of accountability

Whatever a school's level of involvement in ITE, the fact remains that educating teachers can never be the primary focus of the school's activity, which always remains the education of its own pupils. Notwithstanding the perceived advantages of such involvement, a school's ITE involvement can be demanding and can potentially be viewed as a distraction from a core focus on pupil learning. Schools remain responsible for the performance of their pupils, while accredited ITE providers are

accountable elsewhere – namely for the quality of the ITE program and the effective working of the partnership. Partnerships must demonstrate not only compliance with a range of statutory requirements, but also that they prepare their beginning teachers sufficiently well to enable them to meet the relevant professional standards. New models of partnership (particularly those associated with the development of School Direct in England) can also be “*extremely resource-intensive in terms of administration for both universities and schools*” (McNamara and Murray, 2013, p. 16), meaning an additional demand on the limited resources available.

Just as a school’s priority will inevitably remain the education of its own pupils, there will also be related priorities within universities that offer teacher education programs. It has to be acknowledged that those working in university ITE partnerships will also have a wider responsibility within the institution in which they operate to engage in research and scholarship. Indeed, it is precisely because of their familiarity with, and continued production of, educational research, that universities have a role to play in ITE. Much of that research will be both driven by and inform the ITE programs to which they contribute. For many, this is not an optional extra, but a core part of their role as university-based teacher educators.

Where schools are simultaneously engaged with different models of partnership, which is by no means unusual, comparisons between individual partnership models are inevitable. At Waterside, our case study school, where the SCITT partnership is essentially managed by the school itself, there are fewer obvious conflicts in terms of priorities than if the program were being managed elsewhere. Channels of communication and line management structures are already established internally, and the immediacy of the partnership and the close involvement in it of staff within the school appear to give a sense of collegiate working with common goals. Furthermore, although resourcing is highlighted as an issue and, in particular, the time required to mentor trainee teachers effectively, there is a recognition that program directors are sensitive to such issues and are responsive, wherever possible. This responsiveness depends largely on established relationships within the school so that accountability for the ITE program becomes part of the general accountability within the school as a whole. Where schools are working in partnership with external accredited providers (such as a university), accountability across the partnership as a whole for the quality of the ITE program may be less easy to achieve.

Schools often engage in complex partnership arrangements with different providers

In England, schools (and in particular secondary schools) have become used to working in partnership with a range of different providers often leading to quite complex partnership arrangements (Mutton and Butcher, 2008). Differences may be evident in program structures and models of delivery, program documentation, the nature and frequency of the school-based experience, approaches to assessment, mentoring approaches etc. The practicality of negotiating a range of partnership relationships with a number of different providers may lead to attempts to rationalize school-based provision wherever possible, but there is a potential danger here in that “(t)he complexity and contestability of professional knowledge is therefore no longer seen to be at the heart of what partnership is about; professional knowledge becomes simplified, flattened – it is essentially about contemporary practice in schools” (Furlong et al., 2006, p. 41).

The policy changes at national level described above have enabled schools such as Waterside to seize the opportunity to become more actively involved in the training of teachers through its own SCITT program while at the same time continuing to be part of an existing and well-established partnership relationship. In many ways the tensions that could arise are not evident in this specific school context because it operates both ITE programs almost entirely separately. Subject departments within the school may host trainees from either program, or even from both at the same time, but in the case of the latter, school-based teacher educators will work only within one program (for example, separate mentors will work with the beginning teacher from each program respectively). In this case, rather than looking to align school-based provision across both programs, keeping provision within each program distinct has enabled the school to manage any potential complexity.

The implications for partnership in ITE as an “epistemological and pedagogical concept”

While the case of Waterside Academy illustrates the way in which one school has negotiated the complexity of partnership working there is a more general question as to the extent to which beginning teachers, who are training within programs which have developed as a result of recent government reforms in England, are able to draw effectively on sufficient sources of knowledge and, additionally, are provided with opportunities to interrogate critically the knowledge gained from these sources. The Universities’ Council for the Education of Teachers (UCET) has recently argued that, within collaborative partnership models, the focus is on preparing teachers who are,

- *competent and confident professionals who recognize and understand that educating is a professional, thoughtful and intellectual endeavor. They learn from research, direct experience, their peers and other sources of knowledge.*
- *epistemic agents, who act as independent thinkers, recognizing that knowledge, policy and practice are contestable, provisional and contingent. As such, teachers search for theories and research that can underpin, challenge or illuminate their practice. They are able to analyze and interrogate evidence and arguments, drawing critically and self-critically from a wide range of evidence to make informed decisions in the course of their practice.*

- **able to engage in enquiry-rich practice** and have a predisposition to be continually intellectually curious about their work with the capacity to be innovative, creative and receptive to new ideas emerging from their individual or collaborative practitioner enquiries.
- **responsible professionals** who embody high standards of professional ethics. They act with integrity and recognize the social responsibilities of education, working toward a socially just and sustainable world. (UCET, 2020, p. 1, original emphasis)

If these professional qualities are seen as desirable, then the question remains whether ITE programs can provide sufficient access to rich learning opportunities that will enable beginning teachers to develop such qualities. Evidence suggests that policy reforms in England, and in particular the introduction of School Direct, have led to a context in which:

(i)ncreasingly, teaching is conceived in craft-based, technicist terms strengthened by increasing prescription and performativity measures, which require teachers to present and shape knowledge in particular ways. Within this context, conceptions of the relationship between theory and practice have been progressively replaced by conceptions of practice that integrate situated conceptions of theory responsive to the needs of practice.

(Brown et al., 2015, p. 5).

Jackson and Burch (2016), however, argue that ITE policy reforms, and in particular the introduction of School Direct, provide an opportunity for a new conceptualization of the teacher educator working within ITE partnerships, which they refer to as “*hybridization*” (p. 517). They suggest that within such a model, previous unhelpful distinctions between theory and practice might be reduced, through a re-conceptualization of the role of the teacher educator (whether school-based or university-based), to enable both to work together to “*provide a principled pedagogical path through a changing landscape of education policy*” (p. 511). While such a suggestion might indeed address some of the inherent challenges of partnership working, it does appear somewhat idealistic, given that one of the perennial, and perhaps intractable, issues faced by ITE programs is variability in the quality of school-based mentoring (Hobson et al., 2009; Jones and Straker, 2006). (There may also, of course, be significant variation in the quality of the work of university-based teacher educators, although the fact there are fewer of them may make such difficulties less apparent). Nevertheless, the binaries and dichotomies that Jackson and Burch identify lie at the heart of the epistemological and pedagogical challenges within ITE partnerships. We would suggest, therefore, that a useful starting point to address these challenges might be to identify some key principles that could underpin ITE partnership working and apply equally to all contexts and models.

Principles to inform ITE partnership working

Taking account of what we already know about ITE partnerships in terms of policy, pedagogy and practice, we have identified the following principles which we see as being essentially pragmatic:

Principle 1: Partnerships need to have clear agreement in terms of the programme aims (and specifically a shared view of what the desired trainee outcomes should be).

We cannot assume that all ITE partnerships adhere to the same common goals. While all ITE programs in England have to comply with specific regulatory requirements (DFE, 2021) and are also expected to deliver the ITT Core Content Framework (DFE, 2019) as they prepare beginning teachers to meet the statutory Teachers’ Standards (DfE, 2011c), there is no requirement to adopt one particular approach to the preparation of new teachers. Informed by differing pedagogical principles, ITE partners may have different views as to what beginning teachers should know (beyond the government-defined ITT Core Content Framework) and be able to do. If program goals are, however, explicitly articulated and agreed, then a common understanding can be developed and any potential differences mediated by the agreed program goals. The strength of the SCITT program at Waterside Academy could, to some extent, be attributed to commonly understood and enacted program goals, albeit ones that focus primarily on enabling trainee teachers to make the transition easily from the training year to the first year of teaching in a partnership school.

The goals of the university PGCE program (with which the school is also engaged) imply, however, a different approach which requires beginning teachers on the program to draw on a range of *different* sources, both theoretical and practical and, through a process of “practical theorizing” (McIntyre, 1995; Hagger and McIntyre, 2006) to engage in a “*process of hypothesis-testing, requiring interpretation and judgment in action, rather than the routinized application of learned repertoires*” (Burn and Mutton, 2015, p. 221). While these program aims are agreed across the partnership, evidence from our case studies suggests that for some school-based teacher educators this approach may be viewed as an optional extra, rather than a core approach of the ITE program. We must, therefore, be aware that even when program aims are explicitly stated there still needs to be regular review of the way in which these aims are being enacted across the partnership.

Principle 2: Partnerships need a clearly defined learning programme in order for their trainee teachers to be able to capitalize fully on their school-based experiences.

While the temptation might be for school-led partnerships, in particular, to focus predominantly on the classroom performance of beginning teachers, there is a risk of the ITE curriculum becoming more focused on *doing* than on *learning*. To counter this risk, the curriculum needs to be constructed in such a way as to allow for a range of progressive learning opportunities for the beginning teachers, while also ensuring that they have sufficient time both to learn how to plan and to evaluate their teaching experiences effectively.

The challenge for any ITE program lies, however, in balancing two competing tensions: on the one hand not to overwhelm beginning teachers by the scope of what they need to learn and, on the other hand, acknowledging that the nature and complexity of what needs to be learnt is challenging and has to be planned effectively. Beginning teachers might naturally tend to attribute more value to those aspects of the program that they see as having more immediate application. Any ITE program has, therefore, to be both comprehensive in scope, yet able to respond to the teacher's current needs and priorities. Practice-based learning is then "*structured as much as is necessary to maximize learners' cognitive access to the full normal realities of doing the work, but must not distort these realities*" (Hagger and McIntyre, 2006, pp. 49–50). Finally, evidence suggests that, if the capacity for beginning teachers to learn from experience is to be realized fully, they need to be able to draw on as wide a range of sources as possible, including both the expertise of those within the ITE partnership, as well as wider research and scholarship (Hagger et al., 2008).

Principle 3: Partnerships need to consider when and how their trainees will develop the adaptive expertise necessary for sustaining a career in teaching.

As we have already noted, teachers need to be able to move beyond established routines and develop the capacity to innovate (Hammerness et al., 2005), as well as being able to engage critically with suggestions for innovation (Hagger and McIntyre, 2006). Likewise, Berliner (2001), in describing the nature of adaptive expertise, argues that "*expert, domain specific contextualized knowledge can often be a limited kind of knowledge*" (2001, p. 473) and argues that teaching expertise requires the ability to relate innovative practices to an existing knowledge base. Teachers need, of course, to develop efficiency, but also the wherewithal to engage critically with new ideas and suggestions for practice. The latter, Hammerness et al. (2005) argue, is dependent on a complex interplay between four different factors, namely understanding (i.e., a deep knowledge of content, pedagogy, students and social contexts); practices (developing, practicing and enacting a beginning repertoire); tools (the conceptual/theoretical and practical resources to use); and dispositions (habits of thinking and action). More recently, and in a similar vein, Orchard and Winch (2015) have argued that good teaching needs to be underpinned by the principled thinking of practitioners who are able to: understand key educational concepts and the major debates about aims, curriculum and pedagogy that have shaped practice in schools; engage with empirical educational research and be capable of assessing its quality and its relevance to their practice; and think through the ethics of teaching and the challenges of ethical decision making (adapted from Orchard and Winch, 2015, p. 5). This inevitably raises questions as to when, and how, beginning teachers acquire this adaptive expertise.

It could be argued that ITE partnerships should steer clear of the complexity inherent in the process of developing teachers' adaptive expertise and simplify the process of learning to teach as much as possible during the period of initial preparation by focusing predominantly on the acquisition of basic classroom competence. Such an approach does not necessarily imply a rejection of research evidence and theory per se, but instead reflects more a sense that practice – extensive experience and regular feedback – should take priority; research-based understandings or more theoretical considerations can, it could be argued, come later. The question remains, however, as to how teachers are prepared for other contexts where things may be done differently, or where the needs of specific learners may require alternative approaches. Our view is that there needs to be clear agreement within partnerships as to when and how such learning takes place.

Principle 4: Roles and responsibilities within the partnership need to be clearly defined and careful consideration given to the way in which responsibility for different aspects of the programme is managed.

Given that distinctive elements of an ITE partnership will provide a range of different contributions to the learning of beginning teachers, it is important that different types of expertise are recognized and valued and collectively provide an appropriate range of perspectives on which to draw.

Notwithstanding the many strengths of locating teacher education programs more fully within the school context, it is important that school-based training is not wholly focused on preparing new teachers to work in the same, or a similar context to that in which the ITE program is taking place. Partnership directors have an important role to play in ensuring that the model of the ITE program goes beyond that of learning "by imitation" (i.e., where the main approach is to adopt an apprenticeship model).

Furthermore, we would highlight the centrality of the role of the ITE mentor in the overall success of any partnership, although, as we have noted above, the quality of mentoring may be variable across programs. While there are mentoring standards in operation in England (DFE, 2016) that define the characteristics of mentors and the general level of support that they provide, they do not refer to any wider involvement in the planning or delivery of the whole ITE program. Strong partnerships will set out such roles clearly, going beyond the day-to-day support that the mentor provides and including their wider pedagogical role.

Principle 5: Sufficiently high levels of quality assurance need to be in place to ensure consistency, equity and compliance.

Strong partnerships depend on effective quality assurance procedures, with partners taking shared responsibility for regulatory compliance, curriculum content, program delivery and program outcomes. This necessitates a range of partnership-wide features. First, a shared understanding of any statutory frameworks within which training takes place. Second, regular review and evaluation of the program itself to ensure that quality is maintained, taking account of the broader ITE curriculum and its aims, as well as specific elements within it. Third, regular monitoring to ensure that beginning teachers in the program are treated equitably and have access to the full range of learning opportunities available to them. Finally, program innovations need to be monitored carefully and evaluated against previously designated anticipated outcome measures.

Conclusions

ITE partnership working is a complex activity with high levels of risk, given that much depends on its success – not least the need to equip prospective teachers with the knowledge, skills and understanding needed to sustain their future careers. These new teachers need to be able to make sound professional judgements, a process which [Kriewaldt and Turnidge \(2013\)](#), call “*clinical reasoning*” and which they define as the “*analytical and intuitive cognitive processes that professionals use to arrive at a best judged ethical response in a specific practice-based context*” (2013, p. 106). This clearly requires ITE programs to be structured in such a way as to give beginning teachers the opportunity to develop this level of professional competence, which, we would argue, can only be achieved through strongly collaborative partnerships with a high degree of program integration. We have outlined some of the challenges to effective partnership working, particularly in light of recent ITE policy reform in England where a “craft model” has been promoted by the government as the desirable norm. Different models of partnership will, as [Brisard et al. \(2005\)](#) suggest, each inherently contain particular theories about teacher learning and what beginning teachers specifically should know and be able to do, but we have to take care lest, as Alexander warned so long ago, the “*comfortable language of partnership*”, masks potentially damaging “*intractable issues*” (1984, p. 142).

We need, however, to look forward and acknowledge that, in spite of these issues and challenges, there is the opportunity for ITE partnerships to evolve and strengthen. Given the diverse nature of ITE provision in England, we have to embrace the differences in ITE program structures and their related pedagogical approaches but, nevertheless, seek to work in a principled way, whatever the nature of the individual partnership. We would argue that the principles we have set out above are pragmatic, and will enable all ITE partnerships, wherever they are situated and however they are administered, to flourish. We would also argue that ITE partnerships have much to offer in terms of school development within a self-improving school system ([Hargreaves, 2010](#); [Gilbert, 2012](#)), a policy which has been at the forefront of government policy since 2010. Hargreaves identifies four “*building blocks*” of such a system:

– capitalising on the benefits of clusters of schools

– adopting a local solutions approach

– stimulating co-construction between schools

– expanding the concept of system leadership. (2010, p. 5)

It is not difficult to see how ITE partnerships could play a significant part within such a conceptualization of school improvement in a genuinely school-led system, particularly in light of the report of the BERA-RSA Inquiry (2014) which identified “*research literate*” teachers as being key to developing capacity within a “*self-improving education system*” (2014, p. 5). However, in their analysis of the self-improving school-led system in England, [Greany and Higham \(2018\)](#) identify the problematic influences of “*hierarchy*”, “*markets*” and “*networks*” (2018, pp. 10–11) on its effective operation. It is not unreasonable to see similar systemic challenges affecting ITE partnership working, but in setting out our principles we are trying to look beyond hierarchical models of ITE. Tensions will inevitably arise if either ITE providers or school partners see themselves as the “*dominant*” partner, or if one approach to teacher learning is privileged over another. Instead we look positively to recent developments in Wales where collaborative partnership arrangements have been enshrined in the accreditation criteria for ITE providers ([Education Workforce Council, 2017](#)). Here, the

vision is of teachers whose ITE programs have specifically prepared them to meet the demands of a new school curriculum and to operate as agile and innovative intellectuals. ITE is seen in this context as an integral part of a national education reform movement, where both HEIs and schools are *jointly* accountable for the preparation of new teachers through a process of co-construction. Early indications are that the newly accredited ITE partnerships in Wales have established programs which are focused on developing teachers who are both research literate and research active (Harris et al., 2021), through collaborative programs in which university and schools work together as equal partners. Such a vision is also possible for ITE partnerships in England but, returning to the question we posed in the chapter's title, it may be much harder to maintain epistemological and pedagogical underpinnings when the nature of partnerships is determined to such a large extent by market-driven reforms rather than principle.

Introduction

The importance of the early years of a child's life to their development, learning and wellbeing is unquestionable. We know that the first 1000 days of a child's life are critical for their neurological and biological development (Moore et al., 2017). We also know that the effect of trauma during these early years can have a significant impact on the child (Cummings and Swindell, 2019). Drawing on a longitudinal empirical analysis, in *Giving Kids a Fair Chance*, Nobel Prize-winning economist James Heckman writes:

Kids born into disadvantaged environments are at much greater risk of being unskilled, having low lifetime earnings, and facing a range of personal and social troubles, including poor health, teen pregnancy, and crime. While we celebrate equality of opportunity, we live in a society in which birth is becoming fate.

Heckman (2013:1).

Research has shown that high-quality early childhood programs can support all aspects of children's learning and development (Sylva et al., 2010), and that the quality of adult-child interactions are of paramount importance (Tyler, 2016). This points to the need for a skilled, knowledgeable and professional workforce who are guided by policies that are geared toward equity provision for all children.

Like many other OECD countries, early childhood education and care (ECEC) in Australia is a key policy priority area that has passed through a series of reforms in the last decade. Recent government initiatives focus attention on the provision of high-quality services for young children and their families. They call for the raising of standards to ensure the delivery of consistent, accessible, high quality services across the country, and establish processes for continuous improvement and consistency in these services. One policy example is the "universal access to early childhood education" (CoAG, 2008) policy aimed to ensure that all children can participate in a quality preschool program. The National Partnership Agreement on Universal Access to Early Childhood Education focuses on supporting children's early learning and development through maintaining:

Universal access to quality early childhood education programs for all children enrolled in the year before full-time school for 600 hrs per year, delivered by a qualified early childhood teacher who meets National Quality Framework (NQF) requirements, and with a focus on participation by Indigenous children, vulnerable children and children experiencing disadvantage, regardless of the setting in which programs are delivered.

CoAG (2020:3).

Although the "universal access" policy has cost the government over 4.2 billion dollars in the last 12 years (2009–2020), inequality still persists in the ECEC sector (AEDC, 2016; Nolan and Lamb, 2019; Nous, 2020), with poor developmental and learning outcomes for children experiencing vulnerability and disadvantage. Inequality in the ECEC sector continues for children with low socio-economic status, Indigenous status, and non-English language backgrounds (Productivity Commission, 2014; AEDC, 2016). Geographic location also remains a factor of inequality (Raban and Kilderry, 2017). In other words, there are "cohorts of children who are either not accessing a preschool education, or who are not accessing the hours of quality early education needed to make a difference to their development" (O'Connell et al., 2016: vii).

The question remains unanswered: why children experiencing disadvantage still miss out in early learning notwithstanding the successive reforms, the universal access agenda, and the amount of public investment in the sector? This chapter begins by exploring how equity is framed in policies that guide educator and teacher practice. The term "Educator" refers to early childhood practitioners who work directly with children in early childhood settings and hold a Certificate or Diploma (non-teaching) qualification. The term "Teacher" refers to practitioners who hold a teaching Degree qualification. The discussion then moves to identify and explore

the issues that this policy framing misses in terms of contextuality. It concludes by proposing ways for moving the equity agenda forward.

Equity work

The identification of “issues for policy attention” in the OECD report for Australia (OECD, 2001, 2006), along with strong evidence of the major challenges faced by early childhood education and care services, acted as a catalyst for action. These challenges included a lack of access to quality services for children from disadvantaged backgrounds (Press and Hayes, 2001), the fragmentation of the sector’s policy and governance (OECD Review Team, 2001), and Australia’s low public spending on early childhood education among OECD member countries (OECD, 2001, 2006). This triggered the Commonwealth, State and Territory Governments of Australia to embark on a reform agenda. The Council of Australian Governments (COAG from June 2020, replaced by the National Federation Reform Council, NFRC) endorsed the National Partnership Agreement on Early Childhood Education, confirming their commitment to achieving “universal access” to quality early childhood education (CoAG, 2008). Under subsequent National Partnership Agreements on Universal Access in Early Childhood Education (CoAG, 2013, 2015, 2016, 2020), Commonwealth, State and Territory governments committed to ensuring that accessible quality early childhood education is available for all children regardless of socio-economic status or geographic location.

Elsewhere we have written in detail about the rationales and instruments that underpin the “universal access” policy initiative and have problematized related policy documents (see Molla and Nolan, 2019a,b). In this section of the chapter, we will briefly summarize our analysis to make clear the logics of the policies that support equity provision and argue that the policy framings are underpinned by economic, educational and social rationales that impact practice. We begin by outlining how equity issues are framed in policies. Then we move to illustrate the ramifications of such equity framings for the translation of policy to the practice context, and the missed opportunity that is generated by the homogenized representation of the workforce.

Policy framing

The policy frame analysis literature (e.g., Bacchi, 2009; Rein and Schön, 1996; Wagenaar, 2015) suggests that equity instruments made available by governments reflect how inequality is conceived and framed as a problem. That is, the way a public issue is framed has a direct bearing on what strategies are designed in response. A critical frame analysis aims at revealing whose values are authoritatively allocated, and whose interests are excluded in the plan of action. Guided by this assumption, we sought to make sense of the representation of the problem of inequality in Australian ECEC, and to unmask assumptions and rationales underpinning equity provisions in the sector. What our analysis has shown is that disadvantage in the sector has been framed as a lack of access, limited navigational capacity and cultural exclusion, with these policy framings underpinned by economic, educational and social rationales.

The National Partnership Agreement on Universal Access in Early Childhood Education aims at ensuring that Indigenous children and children experiencing vulnerability and disadvantage “have access to and participate in an affordable, quality early childhood education program” (CoAG, 2013: 4). Framing devices such as “universal access,” “qualified early childhood teacher,” “all children,” “cost,” and “barrier” suggest that the governments recognize that there is a lack of access to quality early childhood education. The reforms also recognize inequality in navigational capacity among parents of different socio-economic backgrounds. Scattered ECEC services mean that parents of disadvantaged background (e.g., Indigenous communities in remote areas and recently resettled migrants and refugees) found it difficult to navigate and compare programs and providers. The reform movement in Australia’s ECEC sector was, therefore, initiated in part to “fix” fragmented services and navigational difficulty (CoAG, 2008). Finally, frames such as “cultural safety,” “culturally inclusive,” and “culturally appropriate” presuppose a problem associated with cultural exclusion or domination. Historically, Indigenous people’s knowledge and culture remained “invisible,” or were misrepresented in Australian curricula and educational experiences (Wilson, 2016). Against this backdrop, the Government’s universal access and Closing the Gap policies emphasize the importance of creating culturally inclusive learning environments for Indigenous children.

As noted above, notwithstanding the equity provisions put in place, inequality in early childhood education has persisted along the lines of low SES, Indigenous status, and non-English language backgrounds (AEDC, 2016; Productivity Commission, 2014). One possible explanation for the persisting inequality can be “frame conflict” (Schön and Rein, 1994), which is expressed in contradictions between broad political economy goals and equity needs, and/or between those who construct the policy agenda and those who enact the agenda. For example, framing devices such as accountability and efficiency reflect the prevalence of a neoliberal political economy in the national policy space, which runs counter to the basic premise of distributive justice that prioritizes the standpoint of the least advantaged (Connell, 2009). As Forest and Lombardo (2012) argue, “broader hegemonic discourses [...] define the horizon against which individual frames take place” (p. 17). Our research shows that the social justice goals in the ECEC sector are strategically framed to resonate with the hegemonic economic discourse that has pervaded the education system in general. For example, there is widespread consensus that equitable access to quality education at an early stage in life could contribute to reducing the negative effects of disadvantage in adult life thus making people more productive citizens. This aligns with the government’s economic agenda of enhancing national productivity through investment in education (Molla and Nolan, 2019a). This has been referred to by Cook et al. (2016) as the “neoliberal future-worker-investment discourses” (p. 58) that extend rationality to the ECEC sector, and links inequality in access to quality education as a loss of human capital.

The national and international research literature points to a link between the provision of quality early childhood programs and workforce qualifications. Generally speaking, the quality discourse in the ECEC sector focuses on workforce development, quality assurance and child-centered curriculum. In other words, key elements of quality ECEC services include the availability of adequately qualified early childhood professionals, the provision of stimulating learning experiences for children, lower child-to-staff ratios and active parental engagement (CoAG, 2009: 8–9). In this respect, tackling inequality or widening access to quality ECEC services means ensuring that every child has access to qualified educators, stimulating pedagogical practice, and culturally responsive and inclusive learning experiences.

Contextual translation

Policy statements represent intentions; the transformation of intentions into results, depends on contextual policy translation. For instance, in enacting equity policies, teachers and educators determine “what counts as social justice in their contexts of practice” as they act to interpret policy through the institutional ethos of their workplace, the resources of their setting, and their own social justice dispositions (Molla and Gale, 2019: 858). This active policy engagement positions teachers and educators as key agents in translating nationally prescribed equity-related policies. Here we name the discord between policy and practice to show the impact of framings on the equity work of ECEC educators.

In our research we have identified discords between policy expectations and educator experience and practice that work against an equity agenda. Specifically, we have been able to identify misalignments between policy and practice occurring in relation to making professional judgements, recognizing teachable moments, working closely with families, and recognizing and responding to barriers to children achieving success (Molla and Nolan, 2019a,b). This becomes apparent as educators navigate official expectations of their roles while relying heavily on what they value and choose to follow in their pedagogic practices (Buckler, 2016). Taking a capability approach to human development as the analytical framework for one of our studies, we considered what constituted valued and valuable professional “beings and doings” (Sen, 2009) in the ECEC sector from the view of policy expectations and educator experiences. We did this to closely examine the implication of the neoliberal logic of professionalization for professional capabilities valued in the policy space as well as in the field of practice. The findings highlight that as early childhood educators navigate official expectations of their role, they rely heavily on what they value and choose to pursue in their pedagogic work. This implies that effective implementation of the professionalization initiative is mediated by subjective meaning systems of the educators and objective structures in the context of practice. In other words, policy gets lost in the translation to the context. In our research, we saw tensions between policy and practice in aspects such as what it meant to hold expertise, recognition of the work, and different interpretations of responsiveness to children’s learning. These differences were attributed to a lack of professional agency, policy literacy, and the social justice dispositions of the educators.

Here we focus on social justice. For many early childhood teachers and educators in our studies, there is a propensity to be responsive to certain equity groups at the expense of others. In the professionalization discourse, the Australian Government frames responsiveness of educators in terms of broad inclusion goals along the lines of socio-economic status, cultural background and special learning needs. Practice guidelines propose that teachers and educators hold high expectations for the learning of all the children with whom they work, and “recognize and respond to barriers to children achieving educational success” (DEWR, 2009:13). However, the educators’ accounts of responsiveness in the studies that we have been involved with (Nolan, 2021; Nolan and Lamb, 2019) are narrowly focused. For example, one study while providing many real strengths that the educators were saying, observing, reflecting on and doing in relation to inclusive practice, none of the educators mentioned children from socio-economically disadvantaged backgrounds as targets of their social justice work yet the majority of these educators worked in low socio-economic communities (Nolan and Lamb, 2019). What this points to is a contradiction between those who construct the policy and those who enact it. Without attention to the context within which practice occurs, there is the risk of policy being mis-interrupted, misrepresented, or viewed by practitioners as unrelated to their work context.

As discussed above—not recognizing that practice is mediated by subjective meaning systems and objective structures—highlights that the intent of policy can become lost in translation. Without considering the context such as the life experiences of teachers and educators and what they draw on to inform their practice at the point of policy framing the translation of equity policies can be problematic. In the following section we illustrate how the diverse experiences and life contexts of the ECEC workforce are currently compartmentalized leading to unitary understandings of quality practice. This conceptualization misses the opportunity to build from the strengths and uniqueness of each educator to support policy enactment.

Homogenized ECEC workforce and policy enactment

The professionalization of ECEC has been a focus of attention and debate internationally for a number of years (Dalli and Urban, 2008). In Australia (SCSEEC, 2012), the professionalization of the ECEC workforce through upskilling, is seen as a way of ensuring the effective implementation of the policy reforms which include catering for the diversity of children and families who engage with early childhood services (Torrii et al., 2017; Productivity Commission, 2011). As noted elsewhere (Nolan and Molla, 2018), the professionalization of the ECEC workforce focuses on building pedagogical competence and cultivating professional dispositions. This includes social justice intentionality and cultural sensitivity. As we contend elsewhere (Nolan and Lamb, 2019), the reform agenda aspires for all early childhood educators to be skilled, reflective professionals who can actively support the learning of all children. Educators provide learning experiences for children to achieve equity goals as outlined in practice guidelines which

promotes social justice. Through critical reflection, educators are expected to identify children who could benefit from additional support in their learning, provide that support, and assist families to access specialist services if required (DEEWR, 2009). As the Government put it, “The intent is to ensure that all children’s experiences are recognized and valued” (DEEWR, 2009: 24).

However, the professionalization process in general and the expected equity work tend to homogenize the workforce. The reform agenda links building human capital to ECEC workforce reform based on “scope for the sector to shift from a path of skill atrophy toward a path of skill growth ... along with the scope for professionalization” (Bretherton, 2010: 8). The ECEC workforce is diverse in qualifications, experience, backgrounds and roles undertaken within organizations, yet all educators and teachers are expected to engage with policy documents that guide practice. The ECEC workforce in Australia comprises of staff holding certificate to Masters level qualifications with no differentiation of expectations by Governments on their ability to follow government guidelines and implement government initiatives. For example, the national framework to guide practice (DEEWR, 2009) labels all workers, regardless of qualifications or position, as “educators.” While this might be an attempt to raise the status of the vocationally qualified workers, an unintended consequence may be the lowering of the status of early childhood teachers. This framework fails to recognize the complexity and diversity of the workers; the fragmented nature of the sector; or the alignment of professional identities based on the emotional labor of care in a highly feminized workforce (Dalli, 2002; Blackmore, 2008; Brennan, 1998). Such homogenizing framing does not consider or value the uniqueness of the individual teacher/educator and their engagement with policy discourse. In doing this, an opportunity is missed to harness the rich diversity and the “professional capital” (Hargreaves and Fullan, 2012) of the workforce.

While a link has been established between quality early childhood programs and educator qualifications, educators at all levels of qualification have value to add to current notions of inclusive practice, especially when diversity is the lens (Cherrington and Shuker, 2012). Early childhood educators determine the “discourses that they make available to children and those that they silence, through their daily practices, pedagogies and curricula” (Robinson, 2002:416). As such they should be self-aware of their “unique likes and dislikes” (Vuckovic, 2008:12) as this is considered as “indispensable if the learning environment is intended to be culturally sensitive” (Vuckovic, 2008:12). Through recognition and support of the diversity of the ECEC workforce, it is hoped that other discourses more familiar to the diversity of child and family backgrounds and experiences will be enabled and valued. This means considering early childhood professionalism as “a situated concept” (Oberhuemer, 2008:13) that is influenced by historical, socio-cultural, economic and political contexts (Dalli and Urban, 2008; Oberhuemer, 2008). As Bankovic (2014) reflects, this enables educators immediate and societal contexts to be brought to the understanding and definition of professionalism. A focus on the diversity of the workforce can therefore disrupt unitary understandings of quality practice and hold ramifications for rethinking policy and professional learning.

Moving the equity agenda forward

The United Nations Convention on the Rights of the Child acknowledges “the inherent dignity and the equal and inalienable rights of all members of the human family” (Preamble). This includes young children having the right to an education that helps them fully develop their personalities, talents and abilities (Article 29), with all rights applying to all children whatever their race, religion, abilities, whatever they think or say, whatever type of family they come from (Article 2). Australian research shows that children living with disability, in poverty and in jobless families face multiple, complex and deeper levels of deprivation than their peers (Sollis, 2019). It is estimated that one in five Australian children could be considered as being multi-dimensionally deprived (Sollis, 2019). However, research shows that quality ECEC services can have a profound impact on all children’s outcomes, especially for those children from disadvantaged backgrounds (Elliott, 2006; Harrison et al., 2012; PricewaterhouseCoopers [PwC], 2014). It seems more important than ever to deliver quality early childhood services underpinned by responsive policies that recognize the contexts of children’s lives and the capabilities of the ECEC workforce.

With the policy agenda tied to the delivery of quality ECEC services and aligning quality with the professionalization of the ECEC workforce, there are implications for how equity is framed in policy. In Australia, professionalism within the ECEC sector is currently narrowly framed where measurable outcomes are valued over other more non-measurable attributes such as professional dispositions. In our research these professional dispositions were identified as being caring, having and displaying empathy, demonstrating resilience, patience, having confidence, passion, commitment, showing kindness, and a positive attitude. This seems a missed opportunity to draw on educators’ professional capital to work with children and families and to support them in their professional development as effective early childhood educators. Once workforce diversity is acknowledged, and the alignment of professional attributes valued in the policy space and in the field of practice to understand educator agency are identified, professional learning can be tailored to be meaningful. This learning can better support the professionalization of the ECEC workforce in understanding, enhancing and implementing the equity policy agenda. This is considered an important step “to better understand how practitioners can work effectively with children, families, and colleagues from diverse backgrounds” (Cherrington and Shuker, 2012, p. 89).

For professional learning to be effective there needs to be an association between educators’ aspirations and systematic requirements, a sense of collegiality between participants, critical deliberation in “safe” learning environments where experiences and knowledge can be shared without fear of retribution, and acknowledgment that learning takes place in the domains of professional dispositions, pedagogical knowledge and social capital (Nolan and Molla, 2018). However, unfortunately, our research has highlighted that there is currently no equal access to professional learning opportunities for educators (Nolan and Molla, 2019). This

means that some educators/teachers have very little agency to strengthen their contribution to the early childhood program, advance their professional growth and engage with policy in a more informed way.

Conclusion

In this chapter we have specifically argued that the framing of equity shapes practice in ways where contextually emerging issues such as child poverty are in danger of being overlooked or downplayed. This can lead to educators/teachers having a propensity to be responsive to certain equity groups at the expense of others. We have emphasized that factors such as a lack of expansive policies, the interplay and translation between policy and practice, the unitary understandings and expectations of quality practice for a diverse workforce, and the ability of educators and teachers to access effective professional learning opportunities that build on their professional capital, raise challenges for quality service provision for all children in Australia.

Introduction

International and local organizations, governments, communities, families, and especially teachers have worked since the founding of the United Nations in 1946 to support education that will transform lives, contribute to building peace, reduce poverty, and provide sustainable development across the globe (UNESCO, 2020). Today, efforts to realize this educational future continue on many fronts, especially through the 2030 UN Sustainable Development Goals (SDGs). The SDGs, adopted in 2015 by all UN member states, are a set of 17 goals “to end poverty, protect the planet and improve the lives and prospects of everyone, everywhere” (United Nations, 2015). Among these, SDG 4 calls for inclusive and quality education for all.

At the same time, the global COVID-19 pandemic has had a wide ranging impact on students, teachers, and education systems globally. Before the pandemic, the United Nations had projected that by 2030 more than 200 million children would be out of school and only 60% of young people globally would complete upper secondary education due to teacher shortages at all levels (United Nations, 2020). This has now been exacerbated by the pandemic, where school closures have affected more than 90% of children worldwide with no clear end in sight as of early 2022. While distance and remote learning has been offered in many countries and communities, it is estimated that more than 500 million children, especially those in low-income countries (LICs), have not had access to digital learning (Vegas, 2020).

The pandemic has also exacerbated existing educational inequities for marginalized students. For example, in low-income countries, 79% of children from the wealthiest quintile of the population complete primary school, while the primary completion rate is only 34% for students from the poorest quintile of the population (United Nations, 2020). In order to address these gaps, governments, global organizations, and development and community organizations have begun to focus on learning obstacles and opportunities for the most marginalized students, or those “learning at the bottom of the pyramid” (Wagner et al., 2018, 2022). In focusing on improving educational access and quality for the most marginalized learners within a country, policy makers can address equity issues and raise levels of learning overall. This joint call for both access and quality for the most marginalized students is an ambitious goal, especially in Africa (Bashir et al., 2018).

When considering these long- and short-term challenges, teachers and teaching will play critical roles. Teachers are key actors in supporting student learning and inclusion, and many broader factors and events shape their work with students in classrooms, especially their work with marginalized students. The current global policy landscape is now oriented beyond access to education, and working toward quality and inclusive learning as, and for, development (Wagner, 2018a; World Bank, 2018).

This review focuses on teachers who work with the most disadvantaged and marginalized learners, across and within low-income countries, and begins with an overview of how national and global policies influence the work of teachers.

International policy framework for teachers

Broadly defined, teachers are people who are, formally or informally, expected to be change agents who support children's learning. They work across varied contexts, such as in preschools, non-formal education programs, religious schools, and primary and secondary schools. When considering teachers as agents of change and of learning, it is important to examine current and emerging policy trends that shape the context and content of teaching and instruction.

Teachers represent, as a group, one of the largest professions in developing countries. UNESCO estimates that as of 2020, there are 71 million primary and secondary teachers worldwide. This is more than a 40% increase from 2000, a growth that matches the increase in numbers of children in school (ITFTE and UIS, 2021). Still, more teachers will need to be recruited to support increasing school-age populations and address teacher attrition, particularly in sub-Saharan Africa. Sub-Saharan African countries will need to recruit 15 million additional teachers by 2030; some countries will need more than a 5% annual increase in the number of teachers in their workforce if they are to meet teacher enrollment targets by 2030 (See Fig. 1; ITFTE and UIS, 2021). Unfortunately, such needs are likely to be accompanied by similarly high rates of teacher attrition.

While there are contemporary challenges that influence teachers and teaching in common ways across the world, there are particular educational factors related to context, systems, and resources that impact low-income countries (LICs). In shifting the conversation to attend to global variation between and within countries, international organizations and national policy makers need to refocus attention on the most marginalized learners. In addressing teaching and teachers in low-income countries, we seek to highlight some of the current and emerging issues that shape teachers' work in LICs.

Basic education and literacy have been central to a global policy agenda since the ratification of the 1948 UN Universal Declaration of Human Rights, and re-emphasized at UN-organized conferences in Thailand (1990) and in Dakar (2000). While many governments, international organizations, and development agencies have worked toward realizing this human right to universally accessible, free, quality basic education, the goal will not likely be met for many learners in LICs, at least in part due to the need for improvement in teacher training and teaching.

Global educational development work is shaped in large part by international support for SDG 4, with specific targets for improved learning outcomes for students, with an emphasis on teacher training and improved teaching.

The challenge of inclusive education

Current context

UNESCO's 2020 Global Education Monitoring Report focuses on issues related to inclusion, highlighting the enduring challenges of equity in access to quality education within and across countries globally (UNESCO, 2020). While the SDGs draw attention to equity, inclusion, diversity, and non-discrimination, many learners remain excluded from educational systems. Though progress has been made in improving access to education, even before the 2020 COVID-19 pandemic 258 million children were out of school and remain excluded from a quality education, about 17% of children, adolescents, and youth globally.

Further, when educational development goals focus on national average improvements across education indicators, they can and do miss important variations in learning within countries (Wagner et al., 2018). For example, even though progress has been made in national average school completion rates in LICs, students within the wealthiest quintile in LICs are three times as likely as those from the poorest quintile to complete lower secondary schooling (UNESCO, 2020). Conversely, children living in poverty are the most likely to be disadvantaged when it comes to school access. And in sub-Saharan Africa, nearly 49% of children are affected by extreme poverty.

Migration and displacement impact inclusive education in multiple ways. Nearly half of all child refugees worldwide (especially those who reside in conflict zones) are out of school (UNHCR, 2021). Refugee learners often experience substantial gaps in their

Note: Projections based on UNESCO Institute for Statistics data and methodology in UIS. 2010. [Technical Paper No.3](#).

Fig. 1 Projected teacher recruitment needs in sub-Saharan Africa to meet universal primary and secondary education, 2025 and 2030 Reproduced from ITFTE and UIS (2021).

education due to displacement, and inadequate funding and policies in host country policies (United Nations Stats, 2018). Learners with disabilities are often excluded from formal schooling; 40% of learners with disabilities are out of school in LICs countries at the primary level, and this rises to more than 55% at the secondary level (Global Partnership for Education, 2020). Disadvantaged students – including learners who experience marginalization based on wealth, gender identity and sexual orientation, disability, ethnicity, remoteness, language, displacement, and religion – continue to experience exclusion from formal schooling, even in contexts where overall national progress in access to education has been made; see, for example, the case of Mexico (Schmelkes del Valle et al., 2022).

The role of teachers in inclusive access

It is important to consider how increased school enrollments (driven in part by UN goals), combined with budget constraints in LICs, impact teachers and their work. Countries that expand primary and secondary education access – without concomitantly increasing their teacher workforces – often experience higher pupil-teacher ratios, resulting in lower quality of education (EFA GMR, 2010). In response, some countries reduce entry requirements for teacher training programs or hire contract teachers to meet demand (UNESCO-IIEP, 2021). While the global pupil-teacher ratio in primary education is currently 27:1, in sub-Saharan Africa it is 56:1, and 38:1 in South Asia (ITFTE and UIS, 2021). Larger class sizes negatively impact teaching quality due to limitations on teachers' time with students and families, as well as challenges in classroom management, student participation and engagement, and individualized instruction.

Even as greater numbers of children and youth have access to formal schooling across the globe, inclusion also implies that every learner feels respected and valued, and has a clear sense of belonging. (UNESCO, 2020). Teachers need to be able to ensure that students feel welcomed and included in classroom and school communities, and are able to access content in languages they speak and that builds on what they already know. Further, pedagogical and curricular choices need to be relevant to students and provide opportunities for them to engage in the work of the classroom. To achieve this inclusive form of education, teachers themselves need to represent, as much as possible, the diversity of the students themselves.

Diversity of teachers

Who are the teachers in LICs, and how do their identities and experiences influence inclusive education? Women comprise the majority of the global teaching force; in LICs 88% of pre-primary teachers are female, decreasing to only 41% of primary teachers, and 23% of secondary teachers (ITFTE, UIS, and GEMRT, 2019). This pattern has potential long-term implications for inclusive and positive educational experiences, especially for girls. In addition, refugee educators may be better able to create classroom environments that are perceived by refugee students as more supportive than classrooms of host country national teachers (Richardson et al., 2018). Further, there are more than 240 million children with disabilities globally; and teachers with disabilities themselves have been shown to be able to provide a more welcoming context (UNICEF, 2021). Broadly speaking, research suggests that teacher diversity in terms of social identities – for example, by gender, ethno-linguistic categories, and immigration status) can support students' learning and sense of belonging in the classroom (Evans and Le Nestour, 2019; Gershenson et al., 2017).

Clearly, professional training is designed to overcome common differences between teachers and students. But research shows that about 70% of teachers at the primary school level in LICs have not received formal training, and these teachers primarily work in schools serving disadvantaged learners (UNESCO, 2014). Others have observed primary school classrooms in LICs, and found that students received just under 3 hours per day of teaching, which was about half of scheduled instructional time, and that few teachers evaluated students' progress, checked for student understanding, or gave feedback to students (Bold et al., 2018). Effective teachers can be one of the most important in-school factors to improve student learning (Wagner, 2018a). Diversifying the teacher workforce and providing teacher professional development remain significant challenges for education systems globally, and especially in LICs.

Language and teachers

Language is a critical factor that influences inclusive and effective teaching and learning. The changing demography of student populations, as described above, intersects with the languages used at home and in classrooms (Dryden-Peterson, 2011). There is now growing consensus that children should begin school by learning in their own mother-tongue (World Bank, 2021). This has led to an increased focus on language-in-education policies and practices to meet the changing needs of multilingual and linguistically diverse student populations. Teachers need to be prepared to work in multilingual settings and meet the needs of multilingual learners in their contexts.

This is no easy task for teachers. For example, international policymakers (such as at the UNHCR) recommend including refugees as teachers in host country national education systems to foster integration. But managing the integration of refugees and displaced learners in host country schools, while at the same time promoting the use of mother-tongue instruction, is a major barrier for many teachers. Teachers have to consider their own language practices, students' language practices, and the language policies, resources, and goals of the school, curricula, and community when they teach multilingual students.

Educational quality

Qualifications and pre-service training

To achieve SDG 4, teachers will need training and support. Yet, within the present context of increased demand for quality teachers, along with budget constraints, and growing enrollments, trained teachers have become a scarce commodity. Teachers in LICs, in particular, hold low levels of qualifications; only 70% of primary school teachers and 64% of secondary school teachers in LICs hold minimum qualifications, considerably lower than teachers in middle- or high-income countries (ITFTE 2030 and UIS, 2021). In LICs, most teacher training occurs in vocational upper secondary education, post-secondary, non-tertiary settings, or in short-cycle tertiary settings (typically 2–3 years). However, the possession of a minimum educational qualification is not a highly reliable predictor of teaching quality since a teacher's pre-service program alone does not ensure teaching quality (Akyeampong, 2022).

In-service teacher professional development

As has often been said, teachers need to be learners themselves (Feiman-Nemser, 2012). And, they need ongoing support to do this challenging work, especially if they are going to be prepared to work with diverse learners and provide quality and inclusive education. Teachers in LICs often report limited opportunities for in-service teacher professional development (TPD) programs, especially as it relates to working with marginalized learners (Akyeampong, 2022). During the COVID-19 pandemic in 2020–21, only 29% of countries in sub-Saharan Africa provided professional development to teachers during school closures and the return to schools process (ITFTE and UIS, 2021). In examining TPD programs across low and middle-income countries, teacher TPD programs that are associated with significant growth in student learning have shared various characteristics, including: linking career opportunities (improved teacher status, salary, or promotion) to TPD participation; targeting TPD toward early career teachers; providing complementary curricula materials to TPD participants to use, focusing on a subject-area (instead of general teaching); providing consecutive days of in-person training and follow-up support; and creating opportunities for teachers to practice lesson enactment during the TPD (Popova et al., 2018). There is significant overlap with research in the US on important features for effective professional learning globally (Darling-Hammond et al., 2017). In-service TPD has the potential to support teachers in improving the quality and inclusivity of their teaching practices.

Teacher deployment

The inequitable deployment and allocation of trained teachers also impacts educational quality and inclusion of marginalized learners in the classroom. In order for LICs to provide quality learning to all, schools serving marginalized and disadvantaged students need equitable allocations of trained teachers. For example, Bashir et al. (2018) describe how the Burundian government increased the positioning of trained teachers to rural and under-resourced schools. Subsequently, students from these schools made gains in numeracy scores, relative to their peers in schools with relatively greater levels of resources. While challenges persist, LIC policy makers can provide improved quality education through more carefully designated deployment of teachers.

Contemporary change

Educational technology

Today over half of the total global population uses the Internet; however in LICs this drops to 20% (ITU, 2020). Additionally, significant variation in school-based access to electricity, computers, and Internet in LICs persists, especially in rural schools and at primary grade levels (UIS, 2015). Information and communications technologies (ICTs) can have significant benefits for learning, in and out of schools (Wagner, 2018b), but ICTs also raise many questions about the possibilities and limitations of technology in teaching and learning in LICs.

While interest and scrutiny of ICTs in education has dramatically increased during the global COVID-19 pandemic, policymakers, researchers, and educators continue to ask questions such as: How can ICTs help to improve teaching, learning, and educational quality, and which ICTs should schools and teachers adopt (Hennessy et al., 2021)? What are the consequences for equity and the “digital divide” when ICTs are taken up by some teachers and learners, but not others? How are ICTs relevant for teachers in assessing student learning, communicating with families, working within multilingual contexts, and for teachers' own learning?

These are questions that researchers, policymakers, and educators continue to grapple with as globalization and technological advances continue. Particularly salient examples of the potential for ICT-assisted learning in LICs today include ICTs that can support teachers in schools with high linguistic diversity where teachers are not fluent in the multiple languages spoken by students in classrooms (Wu et al., 2021).

In some settings, ICT-assisted interventions can support teachers working with multilingual learners. For example, Castillo and Wagner (2019) carried out a program in low-performing, rural South African schools that showed promise for supporting students' in early reading development in both English and indigenous languages. Students used a software program in school computer labs to move through self-paced lessons, resources, and practice activities in English and local indigenous languages. This type of ICT use can support teachers in improving the quality of the education that multilingual, language minoritized students receive in their

classrooms (especially when teachers themselves do not share the same linguistic repertoires as all of their students). More generally, such efforts can improve educational attainment for historically marginalized students, such as indigenous and non-dominant language speakers.

ICTs can also be used to support teacher learning and development in settings where teachers have limited access to training and support, such as in refugee-serving and conflict-affected contexts. Mendenhall (2018) reviewed, for example, a teacher development program called for Teachers for Teachers in Kakuma, a refugee camp in Kenya where almost 200,000 refugees from Somalia, South Sudan, and 20 other countries live (UNHCR, 2020). This program used a combination of face-to-face training and peer coaching, in combination with group mentoring via WhatsApp and mobile devices (Mendenhall, 2018). Researchers found that teachers reported improved knowledge and skills, increased motivation and self-confidence, and improved teacher-student relationships. Clearly, ICTs have the potential to support inclusive and quality educational opportunities for refugee teachers and learners through supporting teacher mentorship and learning through digital tools (UNESCO, 2018).

Such efforts using ICTs are particularly salient because of their use with historically marginalized learners in under-resourced settings, rural, indigenous language-speaking students and refugee educators in camp settings. Many LICs have increasingly multilingual populations and are home to significant numbers of displaced and conflict-affected students and teachers. There is little doubt that ICTs will be increasingly deployed in the coming years.

COVID-19 and other mega-trends

The COVID-19 pandemic continues to affect, teachers, teaching, and students globally. During the start of the pandemic in 2020, about 90% of all students (1.57 billion children and youth) were out of school worldwide. Only 25% of LICs offered remote learning to students, primarily through broadcast television and radio programming, compared to almost 90% of high-income countries, which mostly utilized a variety of digital learning approaches (Vegas, 2020).

With schools closures during the pandemic, teachers in many countries pivoted to lead or support remote learning. However, in LICs, where education systems relied primarily on distance radio and television broadcasting to deliver remote learning, teachers received less guidance and support on how to engage students. For example, in sub-Saharan Africa, during the early days of the COVID-19 pandemic in spring 2020, no sub-Saharan African countries provided teacher training on how to best support learners during the closure of school buildings (Vegas, 2020). When teachers are not included in distance learning plans, students may not receive tailored instructional support, instead relying on broadcast TV and radio programming (if they can access these at all).

Even so, some programs provided teachers with remote learning support during the pandemic. The Speed School, an accelerated primary school program for out-of-school learners age 8–14 in Uganda and Ethiopia, has demonstrated success by providing support for teachers to conduct weekly one-to-one visits to students homes or lead “micro-classes” of up to five students in the community, in order to check in with students and parents, provide worksheets and written instructions, and support independent learning (Muskin, 2020). Teacher inclusion in distance learning plans in low-income countries is critical for students to receive individualized support in times of uncertainty. In turn, teachers themselves need support to change how they teach during times of crisis and change.

The prioritization of teachers as central figures who can support education recovery post-pandemic as students return to classrooms has varied widely. Fewer than 25% of sub-Saharan African countries reported recruiting additional teachers to support school re-opening efforts (ITFTE and UIS, 2021). Investments in sustaining and growing the teacher workforce in LICs will be critical to address unfolding demographic shifts, teacher attrition, and increased student need due to the global pandemic, even as two-thirds of low and lower middle-income countries have reduced education budgets since the start of the COVID-19 crisis (ITFTE and UIS, 2021). Impacts of the global pandemic on learners, teachers, and teaching in LICs are yet to be fully understood, but going forward, the international policy community and national governments should consider the potential roles of teachers in remote learning and student support.

In addition to the COVID-19 pandemic, other mega-trends such as globalization, migration, climate change, and sustainability will continue to impact the local, classroom-level work of teachers and teaching in LICs. Globalization has led to advances in science, technology, information flows, transportation, and commerce, which shape education in many overlapping ways. Globalization also shapes teaching and teachers’ work more directly, through the dissemination and promotion of curricula and education initiatives through UN organizations, the OECD, and international organizations, as well as by shaping families’ and societal expectations for learning for 21st century employment (Burn and Menter, 2021; Sorensen and Dumay, 2021; Wagner et al., 2020). For the most marginalized learners in LICs, globalization has also created and revealed inequities in education systems, as learners at the bottom of the pyramid fall further behind shifting international norms (Wagner et al., 2022).

UNHCR estimates that almost 80 million people are forcibly displaced worldwide, and displacement mainly affects developing countries and LICs. Over 20% of the global refugee population reside in LICs, which are home to only 10% of the world’s population, and more than half of the forcibly displaced are under the age of 18 (UNESCO, 2019) as discussed above. This has significant implications for multilingual, inclusive, and quality teaching and teachers’ work.

Additionally, environmental sustainability (or instability) and climate change are major policy priorities across the globe today, and much remains to be done to refocus educational efforts to center environmental adaptation. Climate change is a particular threat in LICs, through damage from weather-related disasters and ecological changes, alongside limited resources to support adaptations and mitigation. Teaching content and curricula about climate change and environmental sustainability is limited across the

globe (Opertti and Brylinski, 2016), and needs to better support students in climate action (Kwauk, 2020). Each of these megatrends needs to be considered as we look to the future of teaching and teachers' work in LICs, in our interconnected world.

Conclusions

As the 1948 Declaration of Human Rights envisioned, education can be transformative for individual learners across their lifespan, and also foster inclusion, equity, peace, development, and understanding within and across communities and countries. These ambitious goals are challenged by persistent inequities based on ethnolinguistic difference, gender identities, socioeconomic status, disability, immigration status, and religion that are deeply entrenched in our global, national, and local education systems. Teachers can and will play roles that impact on societies' ability to sustain and improve education systems.

To address the complex challenges of inclusive and quality education for all, it is critical to understand: (a) the important roles of teachers and teaching within classrooms in LIC contexts; (b) the policies and supports that teachers need to do this their work; and (c) the ways that global megatrends shape every teacher's contexts for teaching. Teachers have the potential, and obligation, to be change agents in finding paths to achieve the UN global goals.

Becoming a teacher doesn't end with the graduation from teacher education. Teachers continue to learn and develop based on their daily experiences in the job. Apart from this informal learning, most teachers will over time also participate in more formal training and learning opportunities (in-service training, school development programs, etc.). The ongoing character of this learning throughout teachers' work lives is highlighted in the concept "continuing professional development" (see e.g. Day and Sachs, 2004).

Yet, teacher development doesn't start with initial teacher training either. Student teachers do not enter teacher education as blank slates, but rather bring with them about 15 years of personal experiences in schools. They have lived and learned in many classrooms, experienced dozens of different teachers, and thus inevitably have built a personal set of ideas and beliefs about what it means to be a teacher, to be teaching, as well as to be a pupil or a student.

Hence teacher development can be defined as teachers' lifelong learning and development that results from their meaningful interactions with their professional context. Understanding this process is of crucial importance for research and theory building on teaching, teacher education and school improvement, but also for practices of the curriculum design and the pedagogical enactment of professional learning opportunities in both initial teacher education and in-service training. Unpacking teacher development implies answering central questions like: What does it mean to live a teacher's life? What does it mean to take on a job as a teacher, to stay in teaching, or to leave the profession? Why are teachers doing what they are doing the way they are doing it? How does teachers' expertise and motivation develop over time and how does this development affect their daily professional practices? In my scholarly work I have addressed these questions through the lens of what I have called the *narrative-biographical perspective* (Kelchtermans, 1993, 2009).

The narrative – biographical perspective

When I started my study of teacher development in the mid-80s, the so-called "teacher thinking"-research had gained momentum (see e.g. Clark and Peterson, 1986; Craig et al., 2013). In line with the developments in cognitive psychology, educational researchers had become convinced that in studying teaching as well as the training and development of teachers a central place had to be given to the cognitions and beliefs that guided their judgments and actions. This line of work stressed the "importance and significance of the pre-active, interactive and post-active dimensions of teachers' personal, practical and professional thinking about the events that defined life in and around classrooms, schools and universities." (Kompf and O'Connell Rust, 2013, p. 23).

In their search for relevant conceptual and methodological approaches of this "thinking" and its manifestation in teachers' discourse and practices, several scholars became interested in *narratives*. Since "narrative is the discourse structure in which human action receives its form and through which it is meaningful" (Polkinghorne, 1988, p. 135), narratives were considered as a powerful way to unravel and understand the complex processes of sense-making that constitute teaching. Teachers' talk about their professional lives and practices is very often spontaneously framed in narrative form. They use anecdotes, metaphors, images, and other types of storytelling to recall, share, exchange, or account for their experiences in classrooms and schools. Storytelling is the natural

[☆]*Change History:* April-June 2021. The text has been restructured and rewritten in a more academic and personal style. The latter implies that I explicitly present an argument as author, based on my own work, while situating it in the wider international research interest and literature on narrative/biography in teacher development research and practice. The introduction and the first paragraph are almost entirely new. §2 is an extended version of the paragraph entitled "Narrative language, context, and voice". §3 is added and a new paragraph. §4 is a slightly rewritten and updated version of the paragraphs "The critical incident vignette", §4.2. retakes most of the content of "Narrative practices with student teachers", as well as large chunks from "Narratives, teacher thinking and professional identity".

way through which people make sense of the events, situations, and encounters they find themselves in. “Humans are storytelling organisms who, individually and socially, lead storied lives. The study of narrative, therefore, is the study of the ways humans experience the world” (Connelly and Clandinin, 1990, p. 2). This evolution came to be known as the *narrative turn* and it constituted an important theoretical, epistemological and methodological development in the way teachers and their work were conceived of (see for overviews: e.g. Carter, 1993; Carter and Doyle, 1996; Casey, 1995; Clandinin, 2007).

Both parallel to and in response to the narrative turn, researchers with an interest in teacher development explicitly linked this approach to teachers’ *biographies*. Especially the revival of the life history research (Ball and Goodson, 1985; Goodson, 1984, 1992) as well as studies of teachers’ careers and work lives (Huberman et al., 1993; Nias, 1989; Sikes et al., 1985) created rich opportunities for conceptual cross-fertilization.

As a theoretical approach the narrative-biographical perspective is characterized by a narrative, constructivist, interactionist, contextualized and dynamic stance (Kelchtermans, 1993). The *narrative* aspect refers to the central role of stories and storytelling in the way teachers deal with the professional experiences throughout their career. Narrative accounts of these experienced interactions reveal the particular meaning they have or had for the people involved. In fact, the perspective focuses on teachers’ work lives as they are lived in time and is less interested in conceiving of it in terms of a formal career (the chronological list of positions a teacher takes up over the years). The concept of work lives explicitly acknowledges the relevance of the sense-making by the person involved and as such rather looks at what could be called the “subjective career”, i.e. teachers’ personal experiences in their professional lives over time (Kelchtermans, 2009). In other words, teachers’ “subjective careers” are reflected in and represented through their narrative accounts of those experiences. *Biographical* refers to the fact that teachers –like all human beings–live their lives between birth and death (see e.g. Goodson, 1984; 1992; Kruger and Marotzki, 1996). Human existence is fundamentally characterized by historicity: people are born at some point in time, live during a particular number of years, and then they pass away. Biographical narratives reflect that in human lives and development context has a temporal as well as a spatial dimension. In these narrative accounts there is always a when and a where. The “when” refers to a particular moment or period in time. The “where” includes the organizational, institutional, political, social, cultural and material environments and conditions teachers work in (e.g. the school with its particular staff, school population, infrastructure, embedded in particular ways in the local communities and in a particular prevailing policy environment – see e.g. Kelchtermans, 2017).

Because human beings are gifted with the capacity to remember and make sense of past experiences, their interpretations, thoughts, and actions in the present are influenced by their experiences from the past and expectations for the future. This influence, however, is not to be thought of in a deterministic or causal sense, but rather rests on complex processes of interpretation and sense-making.

Interpretation and sense-making as crucial for understanding human actions runs as a red thread throughout the narrative-biographical perspective. Through collecting “career stories” or “professional biographies” (Kelchtermans, 2009) it seeks to capture the meaning teachers attribute to their experiences in the job over time. In fact, the story-telling is itself seen as an active and constructive process of sense-making: teachers actively (re)construct their experiences into a narrative that makes sense to them. Career stories are constructed in the act of telling: they are told and can be retold. Their importance and relevance lies not so much in their historical truth, but rather in their power to reveal the particular meaning events have had for the teacher.

This further reflects an anti-deterministic stance: the person is the story of his/her life as s/he tells it. The meaning of (career) experiences for a person thus may change over time. This *dynamic* aspect acknowledges that we don’t need to look for stories as the one (historically) true representation of one’s experiences, but that stories are acts of sense-making and thus may be re-storied over time. In other words, the narrative-biographical perspective on teachers’ work lives “is centered on the practical understandings that teachers develop as they enter into and begin to teach and on the ways in which beginning and/or experienced teachers come to frame their understandings within their life stories or life experiences” (Carter and Doyle, 1996, p. 129).

It is obvious that this meaning making is rooted in the *interactions* with others and the context. Teachers are not only actors, but inevitably also inter-actors, who cannot but engage with others in particular professional contexts.

The promise and potential of narratives

Although teachers’ professional actions are, to an important degree, determined by the structural conditions of policy regulations, institutional environments, and organizational settings, the narrative turn explicitly reminds us that teaching and learning to teach cannot be properly understood without acknowledging the obvious role of *agency*. Teachers are capable of perceiving and interpreting a professional situation giving meaning to it and identifying what issues are at stake. This further implies the capacity to judge the situation, to consider and deliberate between several alternative actions and to eventually decide on a response and enact it in practice. Educating children thus involves planning, knowledgeable deliberation, purposeful intervention, skillful action, as well as the capacity and willingness to take responsibility for it. In other words, teaching as a professional action requires and is constituted by *expertise*.

However, because the ‘objects’ of this action are unique human beings and its eventual goal their individual education and formation, teachers’ work is never entirely instrumental. It is inevitably also a moral endeavor of personal involvement and commitment with the educational needs of the ones that are entrusted to the teachers’ care (see e.g. Fenstermacher, 1990; Noddings, 1984). As a consequence, apart from expertise, professional teaching also requires ethical *engagement or commitment*. Because of this close

connection of expertise and engagement a technical, objective language is too limited to capture the full experience and responsibility of teaching. Because of a series of particular characteristics, narrative language provides ways to get beyond these limits.

First, a core process in narratives is the emplotment: by situating experiences in a narrative, the narrator organizes them in a particular linguistic frame and order (beginning–middle–end) through which the particular meaning of his/her experiences emerges (plot) (see e.g. Brooks, 2003). As such the plot also operates rhetorically and ideologically in that it presents an account of the events that through its coherence and meaningfulness seeks to convince and engage the audience or readership.

Narrative language further performs at the same time a referential and an evaluative function. The referential function describes events and experiences from the past in a temporal order. The evaluative function links the events with the moment of narrating by revealing what the experiences have meant for the people involved in the present (Labov and Waletzky, 1973).

Third, narratives thus always link past experiences to the actual social context. They even constitute that context, because they reflect a need to communicate, to share a meaningful experience with others (Hoepfel, 1983). In the storytelling a particular social setting emerges with different actors and roles. On the one hand, there is the narrator or storyteller who provides the narrative. His/her narrative account allows for the personal, subjective voice to be spoken and heard. Yet, on the other hand, in the act of telling the story there is always an audience already implied. Narratives are told or written by someone, who always by that time has an explicit or implicit idea of possible audiences. As such, the narratives are fundamentally intersubjective or interpersonal in nature. This applies to the direct act of storytelling as well as to different forms of written narrative accounts.

Fourth, the contextualizing characteristic of stories, however, not only includes its spatial dimension, but also the temporal dimension. Stories situate experiences both in space and time. This is most obvious in (auto)biographical stories where experiences from one's personal life are being recalled (life stories). The (auto)biographical stories hence reveal how the narrator's understanding of the present is influenced by experiences from the past as well as his/her expectations about the future.

Fifth, the use of stories and narratives is also valued for its emancipatory power. Narratives allow for the practitioner's voice to be heard and taken seriously in educational research and theory development. Yet, although acknowledging the emancipatory potential, several authors have warned for the trap of subjectivism or a romantic misconception of that emancipation. Creating a space for the voices that are often silenced in educational research is important, but it is equally crucial to recognize that these voices are always interpreted and understood as situated in and thus influenced by political, ideological, institutional, and structural contexts. For that reason authors like Goodson (1992, 2013) have argued for the need to turn life stories into life histories: linking the story to its socio-historical context.

Teacher development in action and thinking: the personal interpretative framework

Teacher development becomes visible in their professional practices as they unfold over the time of their work lives, as well as in teachers' accounts of their actions and experiences. Or -to phrase it in line with the "teacher thinking" legacy-teacher development results in qualitative changes both in actions and in thinking over time (Kelchtermans, 2009).

Based on my own narrative-biographical work I have labeled this thinking with the concept *personal interpretative framework*. This framework encompasses "a set of cognitions, of mental representations that operates as a lens through which teachers look at their job, give meaning to it and act in it. This framework thus guides their interpretations and actions in particular situations (context), but is at the same time also modified by and resulting from these meaningful interactions (sense-making) with that context. As such it is at the same time both a *condition for and a result of* the interaction, and represents the –always preliminary – 'mental sediment' of teachers' learning and developing over time" (Kelchtermans, 2009, pp. 260–261).

The systematic analysis of the data from biographical interviews (Kelchtermans, 1994) led me to conclude that the personal interpretative framework encompasses two closely interwoven domains: the professional self-understanding and the subjective educational theory (Kelchtermans, 2009). The *professional self-understanding* refers to teachers' sense of identity as teachers, the way they conceive of and represent themselves in their professional practice. Within this self-understanding five components could be distinguished: self-image, self-esteem, task perception, job motivation and future perspective. The *self-image* is the descriptive component, the way teachers characterize themselves as teachers. *Self-esteem* refers to the evaluative component of the self-understanding, reflecting one's appreciation of one's actual job performance (how well am I doing in my job as a teacher?). Thirdly, the normative component –the *task perception*–constitutes a teacher's personal professional agenda: what must I do to be a proper teacher?; what are the duties I have to take on if I want to rightly feel that I am doing well as a teacher?; what do I consider as legitimate tasks to perform and what do I refuse to see as part of 'my job'? This normative component clearly reflects the idea that teaching and being a teacher is not a neutral, technical endeavor, but implies value-laden choices, moral considerations, and ethical stances. As a fourth component the *job motivation* (or conative component) refers to the motives that make people choose to become a teacher, to stay in teaching or to give it up for another career. The job motivation is strongly determined by the agenda in the task perception as well as by the degree to which the specific working conditions in one's school permit to operate according to that personal normative program. Finally the *future perspective* encompasses teachers' expectations about their future in the job ('how do I see myself as a teacher in the years to come and how do I feel about it?'). In this last component the dynamic character of the self-understanding is explicitly emphasized: teachers' understanding of themselves as teachers is the result of ongoing processes of interaction and sense-making over time.

Although the five components can be analytically distinguished, they need to be understood as intertwined and interdependent, since -as 'components-together they make up the self-understanding. Furthermore, by using the term "self-understanding" I stress

that it refers to both the understanding one has of one's 'self' at a certain moment in time (*product*), as well as to the fact that this product results from an ongoing *process* of making sense of one's experiences and their impact on the 'self'. This is even more strongly expressed in the original word in Dutch (my mother tongue): "zelfverstaan" is at the same time a noun and a verb and as such already captures the idea of both process and product in its morphology. The narrative nature of the concept self-understanding helps to avoid the possible essentialist pitfall in conceptualizing 'identity'. In this view, there should be no looking for a 'deep', 'essential' or 'true' personal core that makes up the 'real' self (Kelchtermans, 2009, 2018).

By the *subjective educational theory* -the second domain in teachers' personal interpretive framework- I mean "the personal system of knowledge and beliefs about education that teachers use when performing their job." (Kelchtermans, 2009, p. 263). It constitutes teachers' professional know-how, on the basis of which they decide how to act or react in a particular situation. The content is a mixture of on the one hand explicit and formalized insights and understandings as derived from training or personal study (knowledge), and on the other hand beliefs referring to more experience-based, idiosyncratic convictions, built up through different career experiences over time. Although this juxtaposition of knowledge and belief suggests that it concerns two strictly separated categories, in reality teachers' expertise is much more a mix and intertwining of both. The actual border between knowledge (grounded in and based on research) and more personal beliefs (based on individual experience, single cases, 'hear say') is not always that clear. The subjective educational theory reflects the teacher's personal answer to the questions: 'how should I deal with this particular situation?' (= what to do?) and 'why should I do it that way?' (= why do I think that action is appropriate now?). The *content* of the subjective educational theory is largely idiosyncratic and based on personal experiences. Formal knowledge (for example from the curriculum of teacher education programs or in-service training) takes root in the subjective educational theory if (student) teachers have experienced that 'it works for them' or 'is found to be true in their practice'. The same applies to the beliefs (e.g. suggestions or rules of thumb inherited from more experienced colleagues). The epistemological status of the subjective educational theory is that its content 'holds true' for the teacher involved (Kelchtermans, 2009, p. 264).

Narrative and biography in pedagogical practices for teacher development

So far I have presented the narrative-biographical perspective in its potential for research and teacher development. However, its rationale can easily be translated into concrete forms of pedagogy (see e.g. Craig et al., 2014, p. 155 ff). Before elaborating on this rationale in practice, I'll start with presenting a short story of one particular narrative-biographical technique in action.

The critical incident vignette: a storied example

The seminar room fills up with chatter as about 20 student teachers enter, move around, and find a seat in the circle of tables and chairs. Throughout the chatter, I pick up excited comments on their experiences during their recently ended internships. After a brief welcome, I announce that the exercise I want them to engage in will encompass three phases. An individual phase, a group phase, and finally a plenary phase that will take place during the next meeting in the seminar.

As a start I ask all of them to take paper and pen for an individual autobiographical reflection. They are asked to recall the best or worst teacher (the choice is theirs) they have ever experienced during their lives as a pupil or a student. The task is to focus on one typical event or experience with that former teacher and write a short narrative account of the event. A possible alternative assignment is to have them reflect back on their best or worst experience in their school lives as a pupil or a student. The assignment is most often reacted on by the student teachers with surprise, some hesitating smiles or raised eyebrows, but they all soon concentrate on the paper. After only a few minutes everyone is busy writing. Deep sighs, grim looks, and also amused smiles can be observed.

As most of them are about to end their writing, I ask them to find a catchy title for the piece. The title should both trigger the reader's curiosity and summarize the key idea that is supposed to become evident from the vignette. Finally, I ask all the participants to turn the sheet and use the back to elaborate in a more systematic and explicit way what the experience or event has meant to them, what constituted its particular significance, and what possible relevance the story does have for their actual work lives as (student) teachers.

At the end of the meeting, instructions are given for the second phase of the exercise. The participants are being asked to meet in groups of three to perform a triangle discussion. They should themselves pick a time and place to meet and should allow for about one and a half hour for the discussion. During that discussion the participants are required to perform and strictly stick to one of the three prescribed roles: storyteller, sounding board, or listener. The first role is that of the storyteller: s/he starts with sharing the title and the story, followed by her/his reflective analysis of its actual significance. Once the storyteller has finished, the sounding board starts to play her/his role. The person in this role can ask clarifying questions about context, particular details, etc., which the storyteller then answers or explains. Comments or interpretations are to be strictly avoided. They are the privilege of the listener, the third role. S/he can suggest different interpretations or open up alternative ways of viewing the experiences from the story. However, all reflections or interpretations have to remain grounded in the story. No noncommittal speculations are allowed. Finally, the storyteller gets a chance to react with final comments.

Once this round is over, everyone changes roles and the cycle is repeated until every participant in the triangle has performed each of the three roles. The strict distinction between the role of sounding board and listener may have an artificial feel, but it is deliberately included to force the participants to suppress their spontaneous tendency to immediately start interpreting and commenting on the story against the background of their own experiences. Postponing this interpretation adds to the necessary active listening as well as to a growing awareness about one's temptation to engage in overhasty commenting.

The third and last phase in the exercise is a plenary discussion during the next seminar meeting and concentrates on the insights that were revealed through the structured storytelling and analysis. I facilitate the discussion in such a way that the focus is on the participants' actual thinking about teaching and about themselves as teachers as it became apparent from the storytelling. Furthermore, the public reflection should also include relevant elements of the professional context and the relationship between that context and the narrator. A climate of trust and safety is established for the discussion and all stories and reflections are, in principle, being accepted and valued. At the same time, however, critical questions are being asked, alternative interpretations of the incident provided, different types of arguments juxtaposed and commented on. Throughout the discussion, links are made to relevant theoretical perspectives and concepts to (re)frame issues, or to deepen the reflective analysis.

This brief account of the critical incident vignette, as I developed and used in both pre-service and in-service training, is meant as an example of how biographical narratives can be purposefully used to stimulate teacher development. It allows the participants to experience how a personal anecdote reveals not only its meaning and significance at the time when it happened, but also -and more importantly- its relation with the present. The stories from the past reveal a lot about the way the storyteller thinks about her/himself in the present, especially when used with experienced teachers or with student teachers in the final phase of their training (after internship experiences). The context (for e.g., other people in the scene, the organizational conditions, the social and cultural environment in and around the school, etc.) is also included and its particular meaning and impact on the storyteller become evident in the emerging picture. Taking up the different roles contributes to an increased awareness of the social, interactive character of the shared sense-making that takes place. Furthermore, the interactions entail the possibility of breaking up taken-for-granted interpretations, providing alternative understandings of that past experience and – as a consequence – of one's actual situation.

The rationale in narrative pedagogies

The actual practices of using narratives and biographical accounts for teacher development (both in pre-service and in-service training) are quite diverse. Both research and experience from practice show that life stories most often contain events that appear to have had a very significant meaning for the narrator. Often these events are all but extraordinary or spectacular. Sometimes they may even look trivial to others (Kelchtermans, 2009). But for the storyteller these events, encounters, experiences have been turning points, which made them reflect and reconsider their taken-for-granted beliefs and ideas. These so-called *critical incidents* are "key events in an individual's life, and around which pivotal decisions revolve. They provoke the individual into selecting particular kinds of actions, which lead in particular directions. (...) Critical incidents are a useful area to study, because they reveal, like a flashbulb, the major choice and change times in people's lives" (Sikes et al., 1985, p. 57).

The vignette is one exercise that takes up the idea of critical incidents. The assignment to reflectively recall, narratively share and analyze a particularly meaningful event can take different forms. Yet it always involves three steps: (1) description of the event, (2) identification of the issue it raises, and (3) a statement of the sense the narrator made of it with respect to his/her process of learning to teach (Carter, 1993). It thus always aims at triggering a reflective move from the storied event to an analysis of its particular meaning and relevance to the narrator's present thinking and actions.

In a similar vein, another group of narrative techniques or exercises draws on *metaphorical thinking*. Participants are invited to come up with a metaphor to typify themselves as teachers or to define what, in their opinion, constitutes the core of good teaching. These personal teaching metaphors (Bullough and Gitlin, 2001) thus represent, in a condensed, narrative way, their key ideas about themselves as (student) teachers. They may also reveal how these ideas can change over time. As such it makes sense to engage (student) teachers in exercises with personal teaching metaphors or accounts of critical events at different moments during the process of learning to teach (e.g., as an element in a reflective portfolio which they compose during their teacher education or as part of a professional diary). Comparing the differences between the metaphor chosen in the present and the ones developed at earlier stages helps to explore and understand one's personal learning process as well as the experiences that triggered the changes over time.

As such, the use of narratives in teacher education *per se* is also in line with and contributes to the emphasis on *teachers' reflectivity*. Reflection, both as an attitude and skill refers to people's capacity to look back on and think about themselves, their actions, and the situation they find themselves in. Because of the dynamic, highly unpredictable, and complex character of teaching and learning processes, reflectivity is a crucial tool for teachers to properly understand professional situations, choose appropriate actions, and learn from these experiences. Through reflection, teachers thoughtfully examine new knowledge and practical experiences, and integrate them with deeply held beliefs and opinions (Kelchtermans, 2009; see also Lyons, 2010; Schön, 1983).

Narratives and different forms of storytelling have proven to be powerful tools to engage (student) teachers in reflection. Narrative methods allow their reflections to go beyond the technical or instrumental issues of properly using knowledge and skills to achieve effective teaching performances. The latter often dominate (student) teachers' reflections as well as the feedback from teacher educators or trainers on how to improve the effectiveness of one's future teaching performance. Although the importance of this technical dimension in teacher professionalism and development goes undisputed, there is more to good teaching than skillful performance and efficiently dealing with the "how to" questions. Teaching and being a teacher inevitably also involves deciding on moral dilemmas, living through emotional experiences, and dealing with political issues of power and influence. Coping with these moral, emotional, and political dimensions of teaching constitutes an equally important agenda for teacher education and development as do the issues of teaching skills and (content) knowledge (Hargreaves, 1995). Through narrative accounts of teaching experiences, (student) teachers can reflectively address their moral puzzlements (e.g., conflicting norms about good teaching), emotional concerns (e.g., the experience of powerlessness or self-doubt when pupils do not show the learning outcomes one had aimed for), or political actions (e.g., conflicts with colleagues or principals about the most appropriate content or

methodology in teaching). Sharing and discussing these dimensions help student teachers to accept these dimensions as inherent to the teaching profession and thus essential to their self-understanding as teachers. In other words, narrative assignments help to ensure that the content of the reflections is sufficiently *broad* (not only technical, but also moral, emotional and political) as well as *deep* (going beyond the level of actions, to also include one's self-understanding and subjective educational theory) (Kelchtermans, 2009).

In order to achieve this, the different narrative techniques in teacher education and development show a common underlying pattern, composed of two complementary elements. First, the techniques constitute a vehicle for helping the narrators express through different narrative formats their deeply held ideas about themselves as a teacher, their values, and beliefs about (good) teaching, in short their personal interpretative framework. Because of its biographical, experiential, and largely idiosyncratic nature, this framework and the sense-making it engages in may be one-sided, limited, or simply wrong. As such it may negatively bias (student) teachers' learning and sense-making of the formal training curriculum and especially of the experiences during practical training (internships). Several authors have argued that, the often observed 'washing out'-effect of teacher education programs once teachers have started their career, is due to the fact that the implicit personal, interpretative lenses of the student teachers were not deliberately made explicit or discussed. In order to control possible biases and ensure a sustainable, in-depth integration of the training curriculum by the (student) teachers, the pedagogies used have to aim at making this implicit knowledge explicit and bringing it up for critical scrutiny and public discussion. Only this way (student) teachers' personal professional knowledge, as the basis for their professional decisions and actions, can be validated and justified.

Second, this individual, personal storytelling, always needs to be complemented by particular interventions and reactions from the audience, that is, peers and/or teacher educators/trainers. Their comments and questions on the publicly shared narrative accounts aim at questioning, probing, challenging, and deepening the reflective analysis. The storytelling in itself is not enough. Many authors stress the need to link story-telling with forms of narrative inquiry, in which the stories and the beliefs they reveal are critically analyzed, questioned, re-storied. Interpersonal dialog, narrative accounts, and the critical use of theoretical knowledge thus have to go hand in hand (see e.g. Bullough, 2008; Clandinin, 2013; Lyons, 2010).

The striving for authenticity as well as the critical probing of the accounts constitute two essential and necessary principles in narrative pedagogy if it wants to avoid the pitfalls of simply confirming existing ideas and beliefs. Critical and public examination may result either in a more informed conviction and awareness of one's ideas, or in a thoughtful reconsideration and rethinking of what was until then taken for granted.

Although an environment that is supportive, trusting, and positive is a necessary condition to allow the sharing of and learning from narratives to take place, it remains a continuous task for the users of narratives to avoid the trap of uncritical self-affirmation. The way to achieve this is to create and maintain a productive level of discomfort (Kelchtermans, 2009) that helps the critical reflection to move beyond the story as such.

A final reason for the importance of narrative and biography in the pedagogy of teacher education and development is the recognition that the person of the teacher is a constitutive part of the educational situation. Therefore, teachers' ideas of themselves as teachers, their sense of identity is of much greater importance to them as practitioners than in occupations where the person can easily be separated from the craft. When speaking about their job, teachers demonstrate "persistent self-referentialism" (Nias, 1989): their self as a person is always implicated. Developing their professional self-understanding constitutes a red thread for teachers' learning and development throughout their teacher education as well as their work life. (Auto)biographical reflection and narrative accounts allow for this professional self-understanding to become conscious, explicit as well as critically studied and reflected on.

Knowledge [*savoir*] cannot generally be reduced to science, nor even to learning [*connaissance*].

Lyotard (1984, p. 18).

As we considered what we might say about the future of research on teachers' work and lives we realized the topic is rife with ongoing unresolved status and power differentials between university professors and school teachers. In addition, there is an underlying assumption that work and lives can be considered apart from one another. In our research and teaching we make no distinction between the two, understanding that although there are differences between our public and personal lives, they are always intertwined and exist as co-emergent phenomena.

In this article we describe and use a narrative hermeneutic approach to emphasize the importance of prioritizing the local, situated knowledges of teachers when researching their work and lives. Through first person narratives of how teachers and leaders in the city of Fort McMurray in Canada and Saitama City in Japan are using forms of ethical know-how to guide their work and lives in the midst of Covid-19, we show how the co-emergence of nation, city, neighborhood, land, language and culture influence the actions of educators within the context of a global disruption. This context suggests productive approaches to working with teachers to better understand the intertwined situation between their professional and personal histories as these are nested within past and current narratives that shape the social, cultural and political contexts of their work and lives.

Narrative hermeneutics

Emerging from the philosophical writings of Heidegger (1966) and Gadamer (1990) and hermeneutics in education (Carson and Sumara, 1997; Gallagher, 1992; and Smith, 1991) hermeneutic inquiry posits that all experience emerges from and requires ongoing interpretations and that these interpretations are primarily structured through narrative forms and conditions. As Meretoja (2018) explains:

Conceptualizing narratives as practices of interpretation, enmeshed with other socially and historically situated dialogical practices, allows us to see how it is an inherent feature of every narrative that it can be told in different ways, and how our condition as storytelling animals is one of always being in the middle of a dialogue and struggle of interpretations (p. 85).

Narrative hermeneutic processes not only are focused on guiding processes of how stories are told and which stories are told, they also require attention to the ways these stories are influenced by history and culture, including the lived situations of those conducting the interpretations. It is not enough to interpret what was said; it also is necessary to interpret the historical influences leading to that story, the position of the narrator, the power dynamics at play, the ways in which prejudgments influence the narrated story and the storyteller, and the cultural and social contexts of the story and its telling (Meretoja, 2018).

As Smith (1991) has argued, there is a requirement on the part of the researcher using a hermeneutic approach to offer an account of how the process of engaging in research influences the researcher. There can be no separation of researcher from research. As new insights and knowledge emerge, the stories guiding the identities of those involved in the research are changed. Hermeneutic interpretations are not merely reports on knowledge; they emerge from processes that begin with the phenomenological question: "What is this experience?" Along with the hermeneutic question "Why is it like that?" the hermeneutic researcher also must consider the historical, social, cultural, political and ideological influences at play that conditions the phenomenological qualities of experience.

For the purposes of this article, we begin with first-person narratives written by three front-line educators and leaders—Janice, Jennifer and Catherine—each of whom have been thinking and writing about how Covid-19 has influenced their work and lives. We then follow with hermeneutic interpretations of what their narratives reveal when considered within the nested historical, social, cultural and political contexts of their narrated experiences.

Other peoples' children

I (Janice) remember when the Horse River Fire crossed the Athabasca River and made its way into our subdivisions on May 3rd, 2016. We teaching and support staff were at our junior high school that afternoon and, beginning shortly after the lunch period, we became responsible for keeping students calm while trying to reunite them with their families. We also had to worry about connecting with our own children who were scattered about the city at other schools and daycare homes. Staff members were legally obligated to stay in the building and take care of other people's children before our own. It was an intensely emotional time with numerous unknowns.

Our School Principal (Scott), led the reunification efforts that afternoon. At official dismissal time, many staff left the building, anxious to tend to their own children and escape before the flames blocked the only highway out of town. Those who did not have immediate obligations remained onsite to help with the dozen or so kids who had not yet been united with their families. I stayed until about 4:30 that day, at which time there were about half a dozen students remaining in the school.

I learned weeks later that Scott stayed at the school that night with five students who had not yet been claimed because their parents were out of town on business. He was willing to stay with these students that night at the school, but the RCMP came to the school at 10:30 that evening and ordered them to leave. Scott left with those students in his car and made the nearly 5 h drive to the city of Edmonton to reunite them with their parents. I learned later that principals of other schools left students unattended to fend for themselves.

Four years later, we faced a new threat: the Covid-19 pandemic. Many of the same feelings that accompany navigating the unknown surfaced again; disbelief, the burden of responsibility for other people's children, and concern for our own safety became paramount once more. One major difference is that our enrollment is 30% higher than it was four years ago; we now have close to 1000 students. How could we keep Covid-19 out of our building? Amazingly, we are over three months into the school year with no major changes in program delivery and we have not had one known case to date.

From the onset, Scott emphasized that he did not have all the answers, and he invited our input to help plan our re-entry plan for September 2020. I believe that our collaborative approach is part of our current success. I also know that the culture of caring and reciprocity that our students have experienced has primed them to respect the re-entry rules. Ours is a culture of mutual respect and Scott is a leader who practices service-oriented leadership. Most certainly Covid-19 cases will emerge, but we will be able to handle the outbreak. We've stood on the threshold of trauma and uncertainty before, and our staff and students made it through them. We are stronger and more unified for having done so.

Reading an archive of feelings

I (Jennifer) arrived in Fort McMurray to begin my new role as Superintendent nine days before the forced cancellation of all K-12 classes due to the Covid-19. Intellectually I understood that my new role situated me in a community that experienced the greatest natural disaster in recent Canadian history; the 2016 Horse River fire that destroyed hundreds of homes and businesses. Still, I had not yet understood what lasting impact would remain for the people and community or what may be needed from me as their new leader.

With intention, I set out to nurture personal connection and engage in reflective dialog, to learn about the people and community that I would join, what their needs may be, and how I might positively contribute to this system. I wanted to hear their stories. I needed to hear them. Principals, teachers, senior staff members, and community members generously shared their account of that day, describing the lasting impact on their daily lives and professional practice. The initial understanding of the local people and context gained through trust-building and relationship-building has proven to be invaluable as our school system responded to the increasing demands to isolate due to Covid-19. Forces of nature and economics would layer additional pressures and demands on community members as we responded to a 100-year flood during my second month, all the while in a community impacted by a long and deep recession as a result of losses in mining, oil, and gas industries.

In very amplified ways I was living out what I had read about how challenging circumstances require leaders to interpret and make sense of those challenges and be able to communicate those interpretations within the context of daily decisions. My own experience had taught me that small practices between individuals and small groups that demonstrate a strong ethic of care and a narrative of high expectations are necessary within a challenging and complex environment. During my conversations, initially in-person and then online, with principals, coordinators, members of senior leadership and community partners, I listened to not only the words but also took notice of the emotional responses as individuals shared their narrations. Not everything that they needed to communicate could be communicated verbally and I needed to be aware that those silences were forms of knowledge, all of which contributed to an archive that I needed to understand. Those many small actions have made a big difference for all of us as we continue to find ways to ensure health safety along with our other more typical commitments.

Enabling constraints

In Saitama City, Japan after 3 months of voluntary self-restraint all levels of public school resumed. My (Catherine) and my children's return to teaching and school process was gradual and cautious with rules layered upon an already rule heavy system. In a country where a dense population lives, moves, and disposes of garbage on a land mass that fits into the area of California, rules are deemed necessary and children, neighbors, and elders inherently learn to gently pressure deviators into conformity. As a natural freedom-seeking diversity-loving creative soul, this obedience and linearity has often left me exasperated.

At our local elementary school there is colored tape running down the center of the hallways delineating on which side a student should walk, running is of course forbidden. Schools decree size, color, shape of all manner of appropriate school items from lunch aprons, indoor shoes, and gym uniforms, characterless pencils and erasers; even pencil case style is pre-determined. Rules are what keeps the flow from day to day. It also makes school life predictable and safe. Questioning the why, how, or for whom is not built into the curriculum nor the psyche (nor is it typically encouraged), and to be honest, serves a great purpose when a nation is fighting a pandemic (or facing earthquakes, typhoons, or tsunami). When, the call was made across the nation to close schools, there was surprise and apprehension, but very little resistance.

Going back to school came with a new set of rules that I confidently knew would be strictly followed: open windows in the classroom, masks on at all times, water bottles brought from home rather than water fountain drinking, paired desks now separated by a measured margin, no touching or socializing with friends, sitting forward in desks, playground equipment off limits, and no use of instruments, no singing or loud voices. Every morning, students also had to report their temperature in written form to the classroom teacher. Now, in November 2020, with slightly more known about Covid-19 transmission, most of these rules are still in place but not quite as steadfastly as before. Masks continue to be ubiquitous, physical contact is minimized, windows are still open.

Japan's mask culture emerged decades before the Covid-19. Hygiene, flu season, bad breath, anonymity, acne; these are all perfectly acceptable reasons to wear a mask in Japan. Hay fever season alone forces a large percentage of the population to don a mask for several weeks or months every year. As early as January 2020, many families had boxes of paper masks prepared at home and drug store shelves were stocked with these necessary seasonal items well before they were suggested as a possible pandemic counter measure. When the order came, the population at large had no issue with full-time mask wearing in public. We moved directly to the second phase of the discussion: breathability, viral penetrability, washability, ideal fit and comfort, environmental concerns, and of course style.

Japan has a culture that rewards discipline, stamina, and self-sacrifice for a greater good. Awards are given to children who have continuous attendance at school for their entire 6 years of elementary school. That means no sick days are officially taken, or more accurately, plenty of sick days are experienced, but children attend school anyway. This attitude and behavior is rewarded as these children are publicly honored for their robust nature. Having not grown up in Japan and having witnessed my own sickly husband travel an hour on public transport, work a typical 12 h day, come home in worse shape, all in the name of loyalty and self-sacrifice, I have always questioned this germ dispersing practice. Covid-19 is re-shaping this attitude. Now, if a student or worker is unwell in any capacity, they are expected to remain at home.

Learning to count what counts

In the late 1970s the government of the province of Quebec in Canada commissioned the philosopher Jean-Francois Lyotard to write a report on knowledge, which eventually was published as *The Postmodern Condition* (Lyotard, 1984). In that report, Lyotard discusses the status of science, technology and the arts within the context of the emergent post-industrial age and the evolution of what counts as knowing, knowledge, information and legitimation. Pointing to what he describes as an "incredulity to metanarratives" he predicts that:

Knowledge in the form of an informational commodity indispensable to productive power is already, and will continue to be, a major—perhaps the major—stake in the worldwide competition for power (p. 5).

Lyotard argues that these metanarratives must be overtaken by what in the French language are called *les petit recits*—the small stories of everyday life that revolve around the ways we negotiate friendships, intimacies, desires, longings, worries, hopes. He uses the French words *savoir* (know-how) and *connaissance* (personal knowledge) to depict how meanings attributed to similar words can be very different across different languages. Know-how (*savoir*) and personal knowledge (*connaissance*) are not so much associated with measurable facts or normalized conceptions of truth in the form of meta discourses; they are best represented through *les petit recits*—the small stories that orient the micro identities we experience in our moment to moment micro worlds. They are often quiet, subtle stories, rich with detail. As Grumet (1988) has argued, these are the stories about getting the groceries, tending the gardens, sharing a secret, feeling hurt when one's birthday is not remembered. They are personal stories, relational ways of being, long associated with women and children and, as a consequence, not considered to be of much value.

A half-century later, we notice the dramatic amplification of how this now operates within and across so-called formal and informal communication networks. Indeed, advances in digital technologies have not only changed social interactivity they have

changed human consciousness (Edelman, 2004; Hayles, 2005). The radical freedoms of the digital age have become what Foucault (1988) described as the panoptic gaze which he argued was amplified in prisons, hospitals, and schools, but which now has become ubiquitous in all aspects of our digitized cultures and identities. While it is the case that there is more sharing of personal narratives in many ways than ever before, these have not fundamentally displaced the metanarratives and ensuing power plays that continue to orient governments or the policies they create (Harrari, 2018).

In her public annual public Canadian Massey Lectures later published as *The Real World of Technology* (1990) Ursula Franklin argues that technology as a practice permeates and integrates with all aspects of our lives, mostly in ways that become normalized and, as a consequence, not noticed. As new technologies emerge, the qualities of our personal and public experiences change. How do we experience our lives, our work, our identities in this not well-established and rapidly evolving post-modern, post-industrial, post-human world? Franklin argues that the concepts, principles, practices and values associated with the Cartesian oriented Industrial age resulted in the forms of instrumental, prescriptive practices that are amplified in most forms of formal public education. But of course none of this is new or news. However compelling they might be, these philosophical discussions, do not necessarily disclose much about the experience of what Berlant (2011) describes as amplifying precarity in everyday life:

Precarity is an economic and political condition suffered by a population or by the subjects of capitalism generally; or a way of life; or an affective atmosphere; or an existential truth about the contingencies of living, namely, that there are no guarantees that the life one intends can or will be built (p. 192)

Or, we might add, a global pandemic. The Covid-19 pandemic has shown that precarity plays no favorites; there are no walls or categories or systems that can shield individuals, families, communities or nations from its reach. Indeed, Covid-19 has highlighted that there exists an inter-class we could name the precariate—one characterized by heightened insecurity, worry, anxiety and fear. Ironically, what most has united us has emerged at the same time as the imperative to be socially distant from one another. In both inspiring and dispiriting ways, Covid-19 has revealed the fault lines of what we have prioritized and valued and what we have not.

In Canada we witnessed our failure to provide everyday necessities to those in elder care homes, to First Nations communities, to homeless populations, to early years day care facilities, to the poor. At the same time, we have witnessed ordinary citizens—notably front-line health care workers and teachers—respond to the immense challenges of ensuring health safety in communities and schools. For the first time in any of the authors' memories the nightly news features nurses, doctors, teachers. We hear not only their advice, we also hear their stories—ones that give us hope that their local knowledge of patients, students, schools, hospitals—their local contexts—might indeed be what must be prioritized. However, as we have witnessed, the power and impact of the situated knowledges of teachers can only be considered within the histories and metanarratives that guide what counts as normal, correct, valued and needed.

Possible under the circumstances

In a 1960s national radio contest, Peter Gzowski of the Canadian Broadcasting Corporation challenged the nation: "Complete the adage, As Canadian as" As it turned out listeners heard the contest as a quest for something quintessentially Canadian—a symbol to fit our nation. Most submissions were predictable (e.g., a fresh snowfall, the Royal Canadian Mounted Police). In the end, the winner was not an image or a metaphor but, instead an ironic (some would say satiric) commentary on the Canadian character: "As Canadian as possible ... under the circumstances."

Owing to Canada's historical emergence as a nation that embraced cultural and social accommodation over assimilation, a cultural mindset of ongoing adaptation became the norm (Sumara et al., 2001). However, this may not be a uniquely Canadian quality. One could argue that all nations continue to inhabit and adapt national identity in ways that are *possible under the circumstances*. What we notice, however, is that there are profound differences in the ways in which narratives that guide national identity influence responses to emerging circumstances.

With the industrialization of education came an assumption that replicable across contexts best practices could be applied and lead to desired learning outcomes (Clifford and Friesen, 1993; Davis et al., 2000). For most of the latter part of the 20th century and the first part of the 21st century we have seen movement to continue to standardize not only curriculum and learning outcomes, but also approaches to teaching—and more than we might care to admit—teachers (Friesen and Jacobsen, 2020). However, what might work in one national or regional context may not work or be appropriate in another. Catherine's narrative, for example, demonstrates clearly how and why Japan has been successful ensuring high degrees of health and psychological safety in the midst of Covid-19 threats in schools and elsewhere. Most notable is that there was never a required or enforced national shut down or quarantine but, instead, a request that all citizens comply with whatever was necessary to ensure safety for all citizens. This is paired with a national education system, a national curriculum and national education policies.

Canada has not been as successful. Owing to our decentralized confederation of provincial jurisdictions approach to democracy, each of the ten provinces and three territories hold authority for health care and education. Needless to say there have been dramatic differences to the approaches taken—with some provinces requiring many more restrictions in business, community and school settings. In the province of Alberta where four of us reside, the approach has been more aligned with an American-inspired rugged individualism. To date, there has been no provincial mandate to wear masks and only very limited restrictions on businesses and

community engagements. However, even across Alberta there are differences in the approaches used to ensure the health safety of citizens and students in schools. In the city of Fort McMurray, there are differences to be noted—ones which we argue are intricately linked to the city of Fort McMurray's history and, as well, the specific historical teaching and leadership approaches and practices used in different schools.

The new precariate

In 2020 the Covid pandemic showed clearly the precarity and fragility of human life. Indeed, it amplified what [Berlant \(2011\)](#) has argued is the new interclass of the precariate—since Covid knows no class or geographic or political distinctions. We are connected to a planetary ecology in ways that cannot be avoided and, indeed, are necessary ([Bateson, 1972](#)). We also learned a new way of thinking about safety in schools—not only safety from threats of exclusion and bullying but also immediate threats to health. Ironically, it has been a biological certainty about the outcomes of non-compliance to safety that has shone a light on the importance of front-line teachers, teacher assistants and school/district leaders. These complex new challenges and realities in schools all over the world have highlighted three intertwined factors that have implications for how we are thinking about the future of research on the work and lives of teachers:

First, the historical intertwined co-emergence of a nation/region of that nation and curriculum/education policy and practice has a profound influence on how structural and/or procedural changes occur—including those changes that become suddenly urgent and necessary ([Davis et al., 2012](#)). The prevailing discourses on learning and teaching are strongly influenced by those historical developments, including the ways in which teachers are regarded by society and the ways in which their personal and professional ways of knowing are either counted or not counted at the level of local and national decisions on approaches to education. For example, there are marked differences between the status of teachers in Japan and in Canada. Teachers have very high status in Japan and are considered to be reliable authorities by parents and members of the public. In part, this is linked to Japan's view of the school as a moral community, with teachers as leaders not only of academic development and achievement, but also of ensuring adherence to Japanese cultural and social values. While this is also true to some extent in Canada, the authority of the teacher is much more limited. Indeed, the ongoing contestations about where the line is drawn between and among parental, religious and cultural values and those included in programs of study become areas of tension and contestation for teachers ([Cereluk, 2008](#); [Sumara, 1996](#)).

Catherine's narrative about her experience as European descended Canadian born woman who for more than 20 years has taught and parented in Japan shows how the specific histories of what it is like to be considered a good citizen in Japan interweave with what it is like to be a good teacher. Although she admits to having felt somewhat constrained by the many rules in Japanese society and schools, she also explains how they became important enablers as Japan learned to adapt to daily life that included Covid-19. In Japan, the duty to nation both in and out of school conditioned a much safer and less volatile experience of teaching and learning. At this writing, Japan continues to maintain low Covid-19 transmission rates, with all schools fully open and operational.

With over 20 years experience as a classroom teacher, Janice describes how her high school of over 1000 students in the city of Fort McMurray in the northern part of the Province of Alberta has remained virtually free of any cases of Covid-19 since resuming classes in September. This is an incredible outcome given that the Government of Alberta has not required mandatory mask wearing. Despite dramatically escalating cases of Covid-19 in the last few weeks of 2020 the province has not required any kind of mandatory lock down, even in major cities where the cases are escalating at alarming rates. Ironically, they *have* closed secondary schools requiring online learning for the remainder of this term, but have *not* closed major retail ("big box") outlets. The small stories leading to deep culture of ethical know-how and trust that created conditions for Janice's high school to remain Covid-free will *not* be counted as an extraordinary success story in the Canadian province of Alberta where personal freedoms to choose have taken priority over health and psychological safety.

Over the past several decades the city of Fort McMurray has been in the news many times, owing to the fact that it is the primary urban center for the surrounding oil and natural gas industries. Originally inhabited by the Cree First Nations peoples who used the surface oil deposits to waterproof their canoes, the area that became the city of Fort McMurray was central to the fur trade in the 1800s. Commencing in the 1920s with dramatic expansion from the 1970s to the 1990s Fort McMurray became the service city for the lucrative oil and gas energy industries. However, over the past 20 years it has become severely challenged by massive wild-fires, floods and the collapse of oil and gas prices and demand. Despite this, the citizens of Fort McMurray, many of whom came there from other parts of Canada and all over the world, have demonstrated what Canadians would identify as an optimism handed down from histories of learning how to thrive in new challenging situations—as *Canadian as possible under the circumstances*.

In her narrative, Janice describes the kind of trust and collective commitment that has emerged over the years owing to the leadership style of their school Principal. She attributes the success they have had with maintaining not only health but also psychological safety in their high school as connected to a service-leadership orientation by their Principal that is not limited to creating conditions for academic success. That their high school has remained Covid-19 free while others in the city and in the Province have had major outbreaks can only be explained as the outcome of what [Varela \(1999\)](#) describes as ethical know-how in action:

Truly expert people act from extended inclinations, not from precepts and thus transcend the limitations inherent in a repertoire of purely habitual responses (pp. 30–31).

For Varela, ethics is not something known in advance and then applied uniformly when needed; instead, ethics is knowing the right thing to do in a particular situation. Furthermore, ethical know-how must always consider the micro identities and micro worlds that add up to our individual and collective experiences. The practice of ethical know-how from Scott the school Principal had a profound impact on the lives of teachers and students. It conditioned and sustained their ability to remain safe during a time of disruption in a city that has experienced unnecessarily heightened precarity owing to weak provincial government leadership.

Jennifer's narrative tells us what it was like for her as the new Superintendent of Schools for Fort McMurray to enter a school and urban system that was about to experience another highly precarious situation after a decade of working through the devastations of catastrophic floods, fires and economic collapse. Not revealed in her narrative is her many years experience as a certified school psychologist. With in-depth experience working with students and families presenting unique and challenging social, emotional and intellectual needs, Jennifer brings to her system leadership a well-developed capacity to listen closely for signs of the effects of trauma—whether these be the result of one major event or what Cvetkovich (2003) describes as a more insidious type emerging from daily experiences of emotional and psychological neglect and/or abuse. These forms of trauma emerging from systemic exclusions and bullying are difficult to remedy owing to the ways in which individuals and groups are silenced within an organizations or institution (Probyn, 2005; Sumara, 2020).

The prevailing discourses on education in any nation will be closely linked to the primary discourses about what counts as success and the way these influence perspectives on the future. In Japan the meta-narratives about what counts as successful can be attributed to deep cultural beliefs about the importance of the nation as a whole and the duty of all citizens to work toward ensuring continued stability and prosperity. In part, Japan's success with Covid-19 containment emerges from the strong way Japanese citizens without force by the government of Japan have complied with all of the health safety recommendation. In a nation that to outsiders might seem to be overly constrained with many rules, the success with maintaining full business and education operations throughout most of the pandemic has demonstrated how compliance to a collective ethic of care can be enabling. What to some Canadians might feel like lack of individual free choice has created conditions for a less precarious existence in Japan.

Second, the growing resistance to discourses and practices of evidence-based practice in schools where what counts as data are those things normally considered measurable in the absence of more embodied, intuitive forms of knowing that guide daily decision making becomes amplified during times of increased precarity. In the province of Alberta, for example, standardized achievement exams were canceled in June, with teachers being asked to determine final grades based on classroom work, not unlike the approaches to education experienced in Alberta in the 1930s and 40s when Deweyan inspired progressive education trusted teachers to teach in ways that were more student and local community centered. Over the past few months there has been virtually no discussion in the media of trying to measure or count learning or achievement. Instead, the more relational, context specific local matters related to learning and teaching have been in the foreground. Owing in part to the blurring of boundaries between home and school during periods of quarantine and school closure more holistic and integrated forms of education were seen as not only preferred but necessary. The work and lives of teachers became much more obviously entwined with the work and lives of parents, caregivers and students. Entire communities stretched to understand what counted as education when that education could not be in a school classroom.

Perspectives on and practices of education in schools have not been subject to the same scrutiny in Japan owing in part to the link between Japanese cultural mindsets about the purposes of education, the high status and authority of teachers, and consistent ways citizens of Japan avoided Covid-19 volatility through compliance to health safety requirements both in school, at home, and in the community. As Catherine's narrative shows, the clarity of the story about what counts as a good citizen is linked to a national curriculum and associated pedagogies that are not usually questioned or contested. Although the programs of studies for all school subjects are the same for the entire country, there also is a requirement that teachers adapt the curricular requirements to the specifically local context and, importantly, that these local accommodations be communicated to parents and the local community. This historical culture of valuing local knowledge and context through explicit links between parent and teacher, school and home, and school and community remained relatively stable and unchanged with the introduction of Covid-19 health risks. Being as *Japanese as possible under the circumstances* has led to relatively smooth adaptive transitions during the last year of Covid-19 disruption.

Third, the emerging skepticism about the liberal democratic story and globalization is losing its luster. As Harrari (2018) has argued, the liberal story has been until recently read as a better alternative to the fascist or the communist story. However, as another metanarrative mostly developed by and for those who already have power and wealth, the liberal story has failed those on the other side of that power. Covid-19 has shown the limitations of all three of these grand narratives—and, in particular, the inabilities of the liberal democratic story at a basic level to respond to the kind of precarity associated with a global health crisis. Indeed, what has become clear is that while the crisis is global, the response and solutions must originate at the level of the local as situated within the regional and national.

Jennifer, Janice and Catherine's narratives about what it has been like for them to teach and lead in the midst of a global health disruption demonstrate the complex ways personal and professional know-how of teachers and leaders are situated in and conditioned by global, national, regional and local histories. They also show how what appears to be the same outcomes (Covid-free schools in Saitama City and a Covid-free high school in Fort McMurray) emerge from different circumstances and for different reasons. We are not suggesting that one or the other situation is better or worse than the other. We are suggesting that when studied hermeneutically through the situated local knowledges depicted in narratives written by front line teachers and administrators our understanding of *why* becomes as important as our understanding of *what* or *how*.

Narrative hermeneutics for teachers and teaching

In this article we have tried to show how the study of the small stories of teachers and teaching that are mostly undisclosed in the context of pandemic can lead to insights that normally are not noticed and/or counted because they are not easily noticed and/or counted. It is important to note that not even *once* in the news have we heard about the success of one high school in Fort McMurray that has maintained health safety in the midst of unreliable and mostly politicized government messaging on Covid-19. Completely hidden—not written anywhere, not counted—is Principal Scott's long standing service-oriented, ethical know-how approach to school leadership. Until we were well into writing this article we did not fully appreciate and understand why Saitama City (and indeed all of Japan) has avoided high infection and death rates related to Covid-19. What from the outside might seem like an overly rule-bound constrained system upon closer scrutiny reveals itself to be more enabling than disabling. Then, of course, there is the question of whether or not we care about or count the importance of intentional, highly relational leadership practices. What does it mean for us to notice and *count* how as Superintendent of Schools, Janice's scholarly and practical knowledge as a school psychologist enabled her not only to be aware at a visceral level of the effects of long-term insidious trauma in her system, but also to know how to create novel pedagogies in the midst of ongoing precarity? How does her ability to notice and read signs of distress influence how she makes daily decisions in the midst of a major systemic disruption? Or at anytime?

Caputo (1987) argues that hermeneutics is for the hardy; it is radical thinking that aims to perceive and understand the tangled interplay among histories, cultures, contexts, identities and lived experiences. Perhaps most radical about hermeneutic inquiry is its reliance on the small stories; the details of everyday life of teachers and education leaders as they move between and among their microworlds of teaching and not teaching, home and school, public and private, know-what and know-how and know-why.

Hermeneutics is not a research methodology per se, nor does it have much to say theoretically about how to teach or how to learn. It is a philosophical orientation that assumes the inseparability of knowing, doing and being that can be applied to different forms of research. When applied to the study of narrative depictions of experience hermeneutic inquiry can create interpretive conditions for the interplay among the historical, the cultural, the political, the geographical, the social (to name a few) to be noticed as these occur in a momentary micro world. It can help us to understand why, for example, the successes with Covid-19 health safety in one high school in Fort McMurray and all high schools in Saitama City cannot really be compared to one another. What *can* be compared are the radical differences that have led to the same outcome—which, as argued by Derrida (1978) means not merely comparing one to another in order to record their dissimilarities. A radical approach to hermeneutic inquiry also requires attention to what has been deferred during processes of regulating right from wrong, normal from abnormal, important from not important, counted from not counted. We argue that the future of researching teachers work and lives must take seriously the idea that the simply told story by a teacher of what happened must count, must be counted, must matter.

Introduction

This article summarizes research that considers teacher learning through professional development involving teacher self-video, that is, where teachers reflect upon and work with videos of their own practice. We examine the theoretical frameworks and models of teacher learning that underpin the design of this research and the associated professional development activities, and the influences these designs have on the roles that researchers, facilitators, experts and teachers have in the learning process. Drawing upon recent literature reviews and meta-studies of video use in teacher professional development, examples of aspects of different designs are used to illustrate the distinctions and commonalities that influence teacher learning from videos of their own teaching. To end we raise issues and challenges both researchers and teachers confront when working with self-video and the tensions that arise.

The use of video in teachers' learning and growth is increasing and has generated much interest since the last edition of this encyclopedia. The availability and capability of video technology has also evolved, coinciding with increasing concerns around privacy and ethics in video use in particular. There is accumulating evidence of the potential of video-based teacher learning (Borko et al., 2008; Sherin and van Es, 2009). However, the opportunities and challenges associated with using video in teacher professional development are continuously evolving which can pose a challenge to both the teachers involved, and the researchers examining the complex roles that videos may play. In this article the focus is on teacher learning through self-video, Major and Watson's (2018) review shows this to be the most widely used way of working with videos in teacher professional development.

In this article, which is focused on reviewing a range of recent research, we do not define what we take learning, change or growth to mean. We note they can be used synonymously and furthermore we concur with the conclusion of a recent review: "Given that the aims of video use center around change for teachers, leading to change in the classroom and change for learners, some theory of change or learning must be present, either implicitly or explicitly" (Coles et al., 2019, p. 127). In the section on theoretical frameworks, below, we aim to draw out some of these theories.

Videos are amenable to being used in a variety of ways by both teachers and researchers. Yet, in all professional development research there is a tension between the roles played by teachers and researchers. If the primary purpose of using video is teachers' learning, then as researching this process is secondary there will be restrictions and limitations on the data available and the questions that can be asked. The richness of the ways videos capture classroom interactions, including interactions with visual or embodied representations, allows for both researchers and teachers to revisit the data with different perspectives, focuses and purposes.

The complexity of the data collected through videos, as does the act of videoing itself, also involves extensive data reduction as some aspects will be foregrounded over others. A considerable amount of research into the use of videos, including self-videos, in teacher education has consequently focused on noticing and awareness (e.g. van Es and Sherin, 2002; Mason 2002; Ingram, 2015). This research is largely driven by two aims. Firstly, supporting teachers to notice a particular, possibly desirable, aspect of practice such as students' thinking, pedagogic practices that are the target of the professional development program, or cultural practices that contrast with their own. Secondly, starting from where the teacher is and what they notice and working with this to explore ways of acting differently (Mason 2002; Ingram and Andrews, 2020). This second approach needs researchers or facilitators to adapt and personalize (Muir et al., 2010) to each individual teacher as they reflect upon videos of their own practice, which does not bring the stability and controls that researchers often seek, and limits the potential of generalizing beyond the individual teacher.

Video enables teachers and teacher educators to watch, and re-watch episodes, practices or phenomena of interest which opens up opportunities to explore, prove and reflect on classroom practices, either a teacher's own practices, or in collaboration with others (Sherin, 2004). As technology develops teachers have access to richer representations of classroom activity but this is accompanied by increasingly complex ethical considerations, the development of new ways of working with teachers, and further challenges which are explored in the final section.

Theoretical frameworks

A variety of theoretical frameworks are drawn upon by researchers interested in video in teacher learning. Many studies bring different theories together, with one theory influencing the design in relation to teacher learning, and another relating to the focus of what is being watched or reflected upon. The use of video is not separable from a theoretical orientation (Coles et al., 2018), and the focus on video in researching teacher learning highlights the diversity of theoretical approaches where terms, such as noticing, may be used in different ways or different words may be used to describe or label similar phenomena (Bikner-Ahsbabs, 2009). Research with teachers (rather than research on teachers) tends also not to make the theoretical basis of the research explicit as there is a need for the research to be of interest and use by teachers themselves in diverse contexts. For example, much of the research discussed below draws from a phenomenological stance where teachers engage with tasks they might use with their own students that position the teachers themselves as learners. This perspective addresses one of the key difficulties researchers face when working with video, that of ensuring that the teachers feel that the videos and tasks associated with video watching, are relevant to their actual classroom practice (Hamel and Viau-Guay, 2019).

Research on teacher learning through self-video has led to the development of frameworks specifically focusing on the professional development process. Examples include the “learning to notice” framework developed by van Es and Sherin (2002) or the “Lesson Analysis Framework” developed by Santagata and Angelici (2010). These frameworks bring together the need to have a purpose to the work with video, the need to choose suitable videos, clips or materials, and tasks that are consistent with this purpose and consideration of the role of the facilitator or expert in this process, which is explored further in the design section below. Many of these frameworks have developed out of work with video cases of “expert” teaching, but are also structures that underpin much of the work with self-video or other types of professional development that focus on the teacher’s own practice. The shift from videos of other teachers to self-video often also shifts the focus to the problems of classroom practice, rather than on “best practice” (e.g., Horn, 2019; Zhange et al., 2011). The purpose becomes that of solving problems, developing teacher decision making (Schoenfeld, 2017) or pedagogical judgment (Horn, 2019).

Case methods have a long history in professional development, including teacher professional development (Sato and Rogers, 2010). With the rise of video use in teacher education, cases have shifted from being predominantly narrative written cases to video-based materials, though written and visual vignettes remain a core research tool in educational research (Skilling and Stylianides, 2019). In teacher education, video work based on the case method approach often focused on the use of videos of “expert” or desirable practice (e.g. Chen et al., 2020; Gröschner et al., 2015). More recently, there has been a shift toward cases where the teachers have selected what the clip is a “case of”, usually an aspect of practice that is the focus of the professional development they are engaging in, or a problematic moment from the teachers’ own lessons (e.g., Hollingsworth and Clarke 2017; Ingram and Andrews, 2020). These approaches to working with cases of practice have led to the development of frameworks that focus on broader aspects of practice to reflect the need to work with cases that teachers find relevant to their practice (e.g., Hollingsworth and Clarke, 2017; Prediger and Neugebauer, 2020; Schoenfeld, 2018). This way of working with case methods has also led to the development of models and theories of learning that we turn to next.

Teacher learning is a complex area of research that continues to evolve over time. There has been a shift in focus from teaching as a set of skills and to a focus on connecting theory and practice, collaborative discussions, and learning continuing over time (e.g., Mutton et al., 2017). While there is considerable research around teachers’ knowledge, attitudes or beliefs, in isolation of practice, research focusing on the use of self-video by teachers often brings beliefs, goals and practice together. Two models of teacher learning widely used in research in teacher learning using video are the Interconnected Model of Teacher Professional Growth developed by Clarke and Hollingsworth (2002) and Schoenfeld’s theory of goal-oriented decision making (2010). In both these models there is a focus on the relationship between knowledge, beliefs and goals (what Clarke and Hollingsworth refer to as the *personal domain*) with teachers’ practice (the *domain of practice*), and the role of reflection or monitoring and enactment or decision making in changing the personal domain and/or the domain of practice. These models allow research to consider teacher learning and growth over time while retaining the complexity of the relationships between knowledge, beliefs, goals and practice. Where they differ perhaps is in the role that the researcher or facilitator plays in teacher learning, and we return to this aspect below.

Noticing underpins a great deal of research into teacher learning using video. Yet researchers have conceptualized teacher noticing in a variety of ways, focusing on the sense teachers make of what they notice in the classroom (van Es and Sherin, 2002), to the classroom objects which teachers attend to (e.g., Star and Strickland, 2008; Luna et al., 2018). Mason (1984, 2002) argues that in order for teachers to develop their professional practice, they need to first develop their own awareness and noticing of experiences in the classroom. This sense of working on or with teachers’ awareness and sensitivities is drawn upon in the “learning to notice” framework described above. Yet for Mason the starting point is what teachers attend to or notice in their own practice and then working systematically, in a disciplined and intentional manner, to notice opportunities for acting differently in the future. While there are similarities here to Sherin (2004)’s ideas of considering antecedents, implications and action possibilities, there is a fundamental difference in what is being noticed. For Sherin (2004) and others drawing on her work, the research into teachers’ learning focuses on their noticing of student thinking often related to a targeted topic of the researcher’s choosing (e.g., Lam and Chan, 2020).

The theoretical frameworks and models used when researching teacher learning through self-video underpin both the design of research studies, and the design of the professional development within which the teachers are learning. It is these designs that we turn to next.

Designs

In this section, we aim to offer examples of how choices of theoretical framework influence the design of ways of working with video. However, before getting to this detail, we offer some general findings, based on meta-studies of relevant literature, about the design of work with teachers and video. Reviews of video-based work with teachers (Major and Watson, 2018; Hamel and Viau-Guay, 2019) report that a key effect of using video is a broadening of teachers' modes of reflections on teaching, or, changes in perception of the classroom, for instance, increased awareness of student reasoning (Major and Watson, 2018). Relatively few studies to date have traced the impact of work with video into the classrooms of participating teachers. Hamel and Viau-Guay (2019) found that reflections based on video were judged to be better grounded than those based on recalling incidents, or on written case studies. Major and Watson (2018) similarly found evidence of enhanced reflection. In other words, we could surmise that the promise of the use of video, which was noted as far back as the 1960s, seems to be well-founded. In particular, video-based work offers powerful opportunities for developing skills of reflection, which are vital for on-going teacher learning. However, it is also clear that there is nothing inevitable about teacher learning as a result of engaging in work with video (Major and Watson, 2018).

Tripp and Rich (2012)'s review, which focused on what we are calling self-video, found that working on video as part of a group, where there were interactions about the video, was preferred by teachers, compared to engaging as an individual; a finding confirmed in Hamel and Viau-Guay (2019). And, where there was group interaction, a consistent finding is that high quality support (e.g., in the form of a skilled facilitator) is necessary to enhance the quality of teacher reflections and subsequent learning (Gaudin and Chaliès, 2015; Major and Watson, 2018; Hamel and Viau-Guay, 2019). It is also the case that few studies document the facilitator's contribution to the mechanism of video-based reflection. The role of the facilitator of teacher discussion of video appears as a critical and yet under-researched issue. We know a facilitator can have a significant impact on teacher learning from video, but we do not yet know how or why – this is an issue we return to in the final "Challenges" section.

Several of the reviews cited above distil dimensions of video use. For instance, Tripp and Rich (2012) offer the following questions, to guide decisions about mechanisms or designs of video-based work with teachers, which offer a neat summary of common issues:

What type of reflection tasks will I ask teachers to engage in during their video reflections? Will I provide teachers with a framework to guide their reflections? Will I ask teachers to reflect individually, collaboratively, or both? What length of video will teachers use for reflection? How many times will teachers reflect on their videos? What methods will I use to determine if video was beneficial for teacher reflection?

Source: From p. 681.

Different approaches and answers to these questions will be appropriate in different contexts. In the remainder of this section, we show how answers to these questions are also driven by theoretical frameworks. We consider three frameworks: two approaches to noticing and one based on the Theory of Didactical Situations (Brousseau, 1997). We cannot be exhaustive in considering frameworks, hence this choice of focus was made to exemplify how frameworks influence design.

As noted above, the word "noticing" is used commonly in research on video with teachers, particularly within mathematics education and increasingly within science education and other sub-fields of education. There are at least two distinct groupings of meaning and each one brings its own implications for the design of work on video and for the roles of participants and facilitators. The two groupings, which we discuss further below, are *teacher noticing*, the phrase adopted by Sherin et al. (2012), and the *discipline of noticing*, in the work of Mason (2012).

The notion of teacher noticing is an aspect of teachers' expertise that includes teachers' decision making during the process of teaching, i.e., what teachers attend to, in-the-moment of teaching, how they reason about what they notice and how they make choices about what to do next. This image of the process of moving from perception to action mirrors a view of cognition as the receipt of information from the environment, the processing of that information internally and a subsequent response. Given this perspective on cognition, it makes sense that work with video can be directed toward teachers becoming more skilled at noticing particular features of the classroom environment. van Es and Sherin (2002), for instance, worked with teachers to develop their noticing of students' mathematical reasoning. When video work has a specific focus, the facilitator needs to be expert at noticing the particular focus and then needs skills to guide and direct teachers toward what might be available to be learnt from the video. Teachers will be in the role of expanding their noticing through interaction with a more expert other. The choice of video clip is significant, in allowing opportunities for the noticing of what is in focus.

For Mason (2012), noticing is about intentional acts: "This is the essence of the discipline of noticing: arranging to alert yourself in the future so as to act freshly rather than automatically out of habit" (p. 37). In other words, the noticing within the discipline of noticing is not so much a feature of expertise (as it is in *teacher noticing*) but a feature of learning to become expert. Mason's form of noticing is about learning from experience and what we can do as individuals in order to learn from experience. The discipline of noticing, as a perspective on human learning, sparked a particular manner of working with video (Jaworski, 1990; Coles, 2013) with a method of attending to the detail of events, as a mechanism to subvert participants' habitual responses to what they observe. Work on video, using this perspective, begins with a reconstruction of what took place (and hence only short video clips of up to 4 min can be used) before moving into a more interpretive phase of discussion about the clip. "Instead of getting people to analyze practices observed on the tapes, we found it more effective to use the tapes as stimuli to get people to recall

and then analyze related incidents from their own teaching.” (Mason, 2012, p. 36). The facilitator role, within the discipline of noticing, requires expertise in managing the two phases of discussion, but does not require expertise in the particular focus of discussion. The focus for the facilitator needs to be on working with what the teachers notice and supporting teachers in alerting themselves to future possibilities. Mason’s approach to noticing has distinct methodological implications. Firstly, the emphasis on the teachers’ own noticing requires that the teachers themselves select the clips from videos of their practice based on where they might want to act differently, not the researchers. It is also the teachers’ reactions to these videoed events that is of interest, not the nature of the event itself.

The Theory of Didactical Situations (TDS) (Brousseau, 1997) is a perspective on teaching and learning that is used to inform work with video, particularly in France, sometimes alongside influences from activity theory (Horoks and Robert, 2007). A key principle for video use, deriving from the TDS, is the need for viewers of a classroom video to perform (prior to watching) an *a priori analysis* of the task which students will be working on during the video clip. This analysis includes the identification of what knowledge students are likely to have, which will need to be adapted, in order to be successful on the task they are given. It is apparent therefore that significant detail about the context is required for this analysis. Some further elements of the TDS may also be introduced to teachers prior to their watching of video, to inform and enrich the subsequent viewing. Quite specific demands are placed on suitable videos for watching using the TDS. A task such as “How many numbers are there between zero and one?” is too broad to allow *a priori* analysis (Coles et al., 2018), i.e., it would not be possible to analyze the adaptations students might need to make to their existing knowledge to answer this, since their responses are potentially so diverse. The challenge (and hence video) would need to be on a question such as “Give me a fraction between a third and a half?” (Coles et al., 2018), where likely responses could be more easily predicted. The facilitator role, using the TDS with video, requires expertise in the TDS itself and a subsequent careful choice of video clip and preparation of pre-watching tasks. There is potentially a delicate skill in terms of how much of the TDS to introduce in any given context. Participant teachers will be in the role of both learning from the video itself and also learning about the TDS.

The brief illustrations, of how three different theoretical frameworks influence quite different designs for working with video, show that decisions in relation to questions such as those posed by Tripp and Rich (2012), quoted above, are not made in isolation. We suggest that working effectively with video flows from principled design, in which ways of working are consistent with a perspective on learning that informs the actions of the facilitator.

Tensions, challenges and future directions

In this final section we turn to discussions around the tensions and challenges we have personally experienced working as researchers, teacher educators, and as teachers ourselves when working with self-video in a variety of ways. These include considering the role of the facilitator when working collaboratively with videos, the nature of expertise within research on teacher learning through self-video, issues around mimicry or practice, and the complex ethical processes involved.

One challenge we have already alluded to in more than one place concerns the role of the facilitator of teachers working with video. We know this role is vital if teachers are to learn from video (Major and Watson, 2018, p. 65) and yet we know little about it. This is an area of research being given increasing attention, particularly within mathematics education. A significant contribution to the literature is a framework developed by van Es et al. (2014), which articulates four central practices and 14 facilitation “moves”. The four practices are: orienting the group to the video analysis task; sustaining an inquiry stance; maintaining a focus on the video and the (subject); supporting group collaboration. While the word “video” appears twice in these practices, they appear to capture quite general aspects of facilitating discussion, not just within mathematics education. A significant question arising from this framework is how a facilitator comes to gain the kind of expertise represented by the practices and moves.

Research into the ways facilitators acquire the knowledge they need points to the significance of reflection on their practice (Beswick and Goos, 2018), either alone (e.g., Krainer, 2008) or supported by other, experienced colleagues (e.g., Chen et al., 2018). The significance of reflection mirrors the benefits, for teachers, of working with self-video. Indeed, research points to opportunities for facilitators to learn about their own practice from researching their own work with teachers (Chapman, 2008; Chen et al., 2018; Jaworski, 2003). There are a small number of programmes designed to enhance facilitators’ skills (e.g., Childs et al., 2014). Another example is the VIDEO-LM project (Viewing, Investigating and Discussing Environments of Learning Mathematics), developed at the Weizmann Institute of Science in Israel. VIDEO-LM makes use of a bespoke analytic framework of six “lenses”, shared with participating teachers, to guide discussion (Karsenty and Arcavi, 2017; Karsenty, 2018). The project also developed six lenses to inform facilitators. The scale of the work (reaching over 1000 teachers to date) necessitated training teachers to facilitate other teachers. The lenses offered to teachers were adapted for facilitators, to support their facilitation (Karsenty, 2020).

It is important to note that not all contexts need facilitation, for instance, when all participants in a video-viewing group are skilled at providing appropriate critique (Barton et al., 2015). In such cases facilitation can become a task shared and led by participants, often the teacher represented in the video (who might select the clip to be watched and the focus for observation).

We are conscious that the research we have reviewed has largely been conducted in the global North, and predominantly in English. There are significant research questions about the role and influence of different cultural contexts and traditions of teacher leadership or development. For instance, there is a huge wealth of expertise within China and Japan around the facilitation of lesson study group discussions (following a live viewing of a lesson rather than a video recording) and we suggest that insights from this body of work could be highly relevant to increasing our understanding of facilitation of work with teachers on self-video.

One key difference between teacher professional development that makes use of videos of “expert” practice and teacher professional development that uses self-video is in the conceptualization of expertise. This difference is also evident when distinguishing between research with teachers and research on teachers. In the intersection between teacher professional development and research, the purposes or intentions of each participant during the project may differ and perhaps contrast. This refers to what [Ingram and Andrews \(2018\)](#) call the “tension of intentions” where the teacher educators, researchers and teachers have different intentions and different perceptions of others’ intentions.

One of the places where these tensions are most evident is in the recommendations made by many researchers around the use of video. For example, [Sherin et al. \(2009\)](#) identify three features of video clips that they argue support productive discourse around students’ thinking: (a) the extent to which the video clip provides windows into student thinking; (b) the depth of thinking shown; (c) the clarity of student thinking shown in video. Yet it is the researcher who makes the decisions around which clips have these properties which pre-supposes the expertise of the researcher and involves value judgements and interpretations of what students say and do, while the teacher who has worked with the class for some time may identify different clips drawing upon their own expertise of the classroom norms and the students within the class. Researchers can also avoid clips where there is ambiguity in what students may be thinking, which can narrow the possibilities for making conjectures, exploring different interpretations or perspectives.

One potential danger of the increasing number and detail of frameworks, both for teachers using video and to guide the actions of facilitators, is highlighted by [Gaudin and Chalies \(2015\)](#) as the “mimicking” effect (p. 56). They summarize this effect as follows: “the high degree of scaffolding used in many studies may (...) be prompting (teachers) to simply express more of what they perceive are the “right” reform-minded ideas” (p. 56). In that meta-study, the authors propose giving space to allow teachers to explore and express what they observe, within the language and practical or theoretical frameworks they use to make everyday decisions in the classroom. We return to the question of the link between working with video and classroom practice in the Conclusion.

The rise of video and other technology has been accompanied by a growing concern around privacy and the ethical obligations to both teachers and students. In the use of self-video in research, there is not a clear dividing line between research, professional development, and normal practice. This makes the articulation of what students and teachers are consenting to participate in challenging and poses problems for ensuring that consent (or not) arises from an informed decision that is freely given ([Fancourt, 2017](#); [Locke et al., 2013](#)). Teacher learning and growth is also not predictable or controllable, which makes anticipating changes to practice during the research an additional challenge. Technology, and in particular videos, also complicates the need to protect the confidentiality and anonymity of the teachers and students whose lessons are being recorded.

Researching teacher learning occurs in a context where the values of the researcher, teacher(s) and communities intersect. These values influence what is noticed, what is “normal” and what is emphasized in work with self-video. There is a risk that both the researcher and the teacher will normalize what fits with their own cultural and educational values, while pathologizing other ways of knowing or working. School disciplines, for example science ([Otrell-Cass, 2020](#)) or history ([Mycock, 2017](#)), also have particular societal and political consequences that reach beyond the classroom that are often visible through the enactment of values in research and teaching.

The ethics of analysis and interpretation come to the fore in professional development itself and the research of teachers’ learning through PD. Each participant is involved in the interpretation of the videos recorded. Teachers engage in self-analysis, which may or may not be influenced by their learning during the professional development. Researchers interpret and analyze the actions of the teachers and students within the video, and the reactions and re-actions of the teachers when viewing the videos. Yet the ethical dimensions of these interpretations are undertheorized. Ethical processes are often restricted to the stage before data collection begins where consent is sought, but the dynamic nature of teacher learning means that the research teachers are participating and engaging with changes throughout the process – so what is it that teachers are consenting to?

Values are also fundamental to the way in which the research is reported. There are layered obligations in all research involving teachers. Appreciative models of enquiry work with teachers, to showcase what they do well. Yet the job of research is to do more than this. Research provides alternative views and potentially a more critical lens which may frame some practices in a negative light, what [Locke et al. \(2013\)](#) refer to as “bad news”. Discussions around practice often need to involve questioning and challenging, contrasting views and potential actions ([Grossman et al., 2001](#)). Video-based learning also involves teachers making their practice public which involves risk ([Vedder-Weiss et al., 2019](#)) and some teachers may feel threatened ([Borko et al., 2008](#)).

Conclusion

In this article we have summarized research that considers teacher learning through professional development involving teacher self-video. We have used examples from research to illustrate the theoretical frameworks and models of teacher learning that underpin recent designs of this research and the associated professional development activities, and the influences these designs have on the roles that researchers, facilitators, experts and teachers have in the learning process. These illustrations highlight the distinctions and commonalities that influence teacher learning from videos of their own teaching. As the use of technology and video evolves and develops the complexities of research designs, including considerations of the roles of researchers and teachers in this process, also need to evolve and develop. The use of self-video has been shown to be an effective influence on teacher learning, particularly when combined with facilitation consistent with what the teachers identify as relevant to or the problems of their own practice. Yet this effectiveness requires researchers to be flexible and responsive in their design and facilitation, raising

new and complex challenges and tensions in this research process. Further research is needed both to theorize use of self-video in teacher learning and into designs of facilitation that support this learning.

Glossary

BAME This is a UK term for non-White British population—Black, Asian and Minority Ethnic

Teacher retention This term refers in different contexts to both teachers staying in the profession and leaving the school sector

Teacher turnover This term refers to teachers moving between schools

Teacher attrition This term often refers to teachers leaving the profession all together

Introduction

This article provides a review of research on the topic of minority ethnic teacher retention as well as an overview of the current research on the state of teacher diversity and minority ethnic teacher retention in England.

There are many good reasons for having a diverse teaching workforce. Available research has demonstrated that teachers from minority ethnic groups are in a position to providing culturally sensitive teaching, understand, communicate, or identify with students from nondominant cultural and linguistic backgrounds the way nonminority educators are often not able to do (see the case for teacher diversity in [Albert Shanker Institute, 2015](#)). International evidence suggests that exposure to teachers from a similar background has potential to help disadvantaged students from minority groups in danger of school exclusion and drop-out attain greater educational success. [Gershenson et al. \(2017\)](#) evidence from multiple settings in the US has demonstrated that a disadvantaged black male's exposure to at least one black teacher in elementary school reduces his probability of dropping out of high school by 40%. There is also research that shows that minority teachers use their cultural knowledge and own experiences as "other" to develop deeper understandings of minority students and their needs ([Gershenson et al., 2016](#); [Santoro, 2015](#)). Students of all, including nonminority, backgrounds benefit from diverse educational experiences.

Teachers from minority ethnic groups continue to represent a small portion of the teaching workforce in the increasingly diverse Anglophone societies such as USA ([Ingersoll and May, 2011](#)), UK ([Haque, 2017](#); [Menter et al., 2006](#)), Canada ([Dandala, 2020](#)), Australia ([Santoro, 2015](#)) and New Zealand ([Howard, 2009](#)). And despite an increase in the proportion of minority teachers over the last decade, a gap persists between the percentage of minority ethnic students and the percentage of minority ethnic teachers, especially in some ethnic sub-groups. The governments have sought to address this student-teacher imbalance through the agenda to boost numbers of minority teachers entering the profession. However, key authors in the field argue that the recruitment of new teachers alone will not solve shortages ([Ingersoll and May, 2011](#)). Scholars and commentators often employ "a revolving door" or "a leaky pipeline" metaphor to emphasize the problem of high turnover and attrition of new teachers once they join the profession. An approach focused on understanding the causes of minority teacher staffing problems in relation to the institutional characteristics and the culture of the workplaces where teachers are employed has been useful to study the phenomenon ([Ingersoll and May, 2011](#)). This article adopts this lens.

International research reviewed in the following section suggests that minority teacher retention and turnover have important implications for social justice in education. These teachers tend to work in urban schools with high-minority and more disadvantaged intakes, which also experience higher teacher turnover rates. Retaining minority teachers is thus crucial for managing teacher

supply in these schools to reduce the negative impact of turnover on the outcomes of disadvantaged children. For example, in England, London experiences acute teacher retention challenges (Worth et al., 2018), while minority ethnic teachers are more open and motivated than White British teachers to remain in teaching in London. There is also some evidence from the US that a diverse teaching staff in high-poverty, high-minority schools promotes retention of teachers regardless of their race (Djonko-Moore, 2016). This suggests that school staff diversity is also an important workplace issue.

Potential explanations of why minority teachers leave

There have been various explanations identified in the literature for the retention and turnover among teachers from minority ethnic groups in the Anglophone countries. The key findings are discussed in turn, although some of them are overlapping and confounding. It is notable that most research in this field focuses on the United States context.

School demographic characteristics

A substantial body of research reveals that a high proportion of minority ethnic teachers work in disadvantaged schools, which predominantly fall into the category of “hard-to-staff” schools. Allen et al. (2018) study of teacher turnover in England found that deprived schools hired younger and more ethnically diverse teachers than affluent schools did. Ingersoll et al. (2019) found that between 1987 and 2012 two-thirds of minority teachers employed in the US public sector worked in high-minority, high-poverty, and urban schools. Moreover, minority teachers were two to three times more likely than White teachers to work in these schools. A US study focused on Black teachers found that while a quarter of all teachers in 2011–2012 taught in schools that were both high-poverty and high-minority schools, about 60% of Black teachers and 62% of Black female teachers (Carver-Thomas and Darling-Hammond, 2017). This study and other research conducted in Canada (Ryan et al., 2009) have also pointed out that teachers of color were more likely than other teachers to work in schools located in large cities.

These patterns of work in schools that face additional challenges could be an explanation for higher rates of minority teacher turnover. Yet, a review of the 70 studies conducted in the US found that “teachers of color are less likely than White colleagues to leave schools serving high proportions of students from low-income and racially and culturally nondominant communities” (Achinstein et al., 2010, p. 90). Looking at the relationship between school characteristics and turnover, Ingersoll et al. (2019) found that minority teachers were slightly less likely than nonminority teachers to move from schools with higher poverty-level enrollments, as well as from larger schools. When they did move from one school to another, six times as many minority teachers did so from high-poverty schools to other high-poverty schools than from high-poverty schools to low-poverty schools, and almost three times as many moved from urban schools to other urban schools than from urban to suburban schools (Ingersoll and May, 2011).

On the contrary, in England minority ethnic and younger teachers had a higher turnover rate in schools situated in deprived neighborhoods than other teachers (Allen et al., 2018). However, while early career retention rates were found to be significantly lower for minority ethnic teachers across all training routes in England (Allen et al., 2016), newly qualified teachers from minority ethnic groups had a better retention rate in urban and diverse Inner and Outer London than White teachers (DfE, 2018). Personal background of minority teachers thus appear to be involved in turnover and retention.

Teacher characteristics

Some research identifies notable trends in minority ethnic teacher retention and turnover by the demographic characteristics of teachers. In Ingersoll et al. (2019) analysis of large datasets gender appears to be a salient predictor in the US schools, with the odds of male minority teachers departing over 50% higher than for female minority teachers. In the same study the age of teachers was a predictor of the likelihood of turnover, but only for nonminority teachers. They found that younger (less than 30) and older (greater than 50) minority ethnic teachers did not depart at higher rates than middle-aged (31–50) minority teachers. However, overall, the data both in the US and UK show that, over the past decades, minority teachers were more likely to depart from their schools than nonminority teachers, with younger teachers more affected (Achinstein et al., 2010). There is also evidence from the US that younger teachers from minority ethnic groups were more likely to be certified via alternative pathways than other teachers (Carver-Thomas and Darling-Hammond, 2017; Redding and Smith, 2016).

A new area of research, relational demography, examines the impact of the race/ethnicity congruence between teachers and school principals on minority ethnic teacher retention and turnover. Nguyen et al. (2020) recent meta-analysis found that the odds of teacher turnover may be smaller when there is congruence relative to incongruence. Grissom and Keiser (2011) have demonstrated, using US nationally representative data, that teachers who are race-congruent with their principal are less likely to leave than non-congruent colleagues in the same school. These findings held true for Black teachers in a subsequent longitudinal analysis of personnel records from both the States of Missouri and Tennessee (Bartanen and Grissom, 2019). It was found that Black principals decreased Black teacher mobility, significantly reducing the probability that a Black teacher changes schools. They also found that teachers gave higher ratings to school leadership, school climate, and their own job satisfaction in years in which they had a race-congruent principal. The next two sections delve further into what might drive these findings.

School working conditions

While the demographic characteristics of schools appear to be important to minority ethnic teachers' initial employment decisions, their later decisions about whether to depart are tied to working conditions in their schools (Achinstein et al., 2010). There is no evidence to suggest that these teachers leave because of dissatisfaction with disadvantaged students. Ingersoll et al. (2019) analysis of the US national teacher survey shows that particular school working and organizational conditions are strongly related to minority teacher departures. The data indicate that minority teachers departed at higher rates because the schools in which they were employed tended to have less positive organizational conditions, including salary, student discipline problems, school leadership support, school resources, faculty influence, and teacher autonomy. For minority ethnic teachers, predicted annual turnover rates were only 12% in the schools with the best organizational conditions versus nearly 21% in schools with the worst organizational conditions (compared to 12% in the best schools to 15% in the worst schools for nonminority teachers). The strongest organizational factors for minority ethnic teachers were the levels of collective faculty decision-making influence in their school and the degree of individual classroom autonomy. For example, a one-unit increase in reported faculty influence between schools (on a four-unit scale) was associated with a 37% decrease in the odds of a minority teacher departing, and a one-unit difference in reported teacher classroom autonomy was associated with a 40% difference in the odds of a minority teacher departing. The authors make a powerful observation based on their simulation analysis that had the schools afforded minority teachers the classroom autonomy held by teachers employed in schools that were in the top 10th percentile of teacher classroom autonomy, it is conceivable that the US would have had nearly a quarter million more minority teachers within a decade.

Racial climate in schools

Many studies that draw on the accounts of teachers conclude that the racism teachers from minority groups are exposed to in schools take a toll on their well-being, progression, and retention. The body of research on minority ethnic pre-service teachers in the UK showed that the participants were negatively affected by placement in predominantly white schools (Basit et al., 2006; Wilkins and Lall, 2011; Bhopal, 2015; Maylor, 2018). Although statistical studies such as by Ingersoll et al. (2019) did not find that minority ethnic teachers departed schools with different proportions of minority faculty at different rates, Bristol (2018) summary of the survey findings across an urban district in the US suggested that racially isolated school spaces promoted Black teachers to leave. Those who were the only Black male teachers on the faculty were more likely than those who were among many more Black teachers to cite tense relationships with colleagues and administrators as their two primary reasons for wanting to leave. They were also more likely to believe that being Black caused people to fear them in their schools.

It is important to note that diverse schools in urban areas have also been perceived as racially hostile, stressful and disrespectful workplaces for teachers from minority ethnic backgrounds. Even in schools serving multicultural communities teachers from minority ethnic groups work within a predominantly White profession leaving many feeling like outsiders. Kohli (2018) research with 218 urban American teachers of color identified two typical forms of racism that affected their professional experiences and retention: (i) color blindness and (ii) racial microaggressions. Schools that adhere to the color blind racist standpoint claim race neutrality, leaving teachers of color isolated and devalued in their efforts to raise equity concerns about the attainment gap between White and other students and to advocate for culturally relevant solutions to various educational issues. The instances of microaggressions refer to the covert forms of systemic racism in schools, including calling teachers by the wrong surname, exposing assumptions based on cultural stereotypes and lack of knowledge about different communities, questioning the relevance of culturally sensitive pedagogy in the climate of accountability, and the like. Microaggressions directed at minority ethnic students are also deeply offensive to these teachers. The findings with respect to invisibility, exclusion and professional "othering" within the "mainstream" teaching community are echoed in research with indigenous and minority ethnic teachers in Australia (Burgess, 2017; San-toro, 2015).

Recent studies have demonstrated that teachers end up leaving schools serving urban students from nondominant cultural communities because of the cumulative impact of "racial battle fatigue", defined by Smith (2009) as "the psychological, emotional, physiological, energy, and time-related cost of fighting against racism" (cited in Pizarro and Kohli, 2020, p. 969). Among these studies is that of Hancock et al. (2020) which explore how the pressure of having to "contend with the mental and emotional stress of navigating whiteness, white fragility as it relates to curriculum content, and constant disrespect for nonwhite cultural experiences and ways of knowing" impacted on one Black teacher's decision to take a prolonged career break (p. 5). Bristol and Goings (2019) interview research demonstrates that having to strategically navigate racial boundaries in the workplace expends considerable energy on the part of Black male teachers. Over time, the battle for recognition and promotion within the racialized power structures of the schools leaves teachers "burned" (Wallace, 2020). These qualitative findings add important explanatory power to statistical analyses of retention factors about what specifically in the school climate encourages minority ethnic teachers to explore opportunities in other schools or leave the profession.

A case study of teacher diversity and retention in English schools

The issues related to minority teacher retention are nuanced by national and local contexts. In this section we explore the situation in England, drawing on our own analyses of systemic data and interviews with minority ethnic teachers. This exploration

demonstrates both the commonalities of employment patterns across contexts, and the specifics of the English context, including regional variations between London and the rest of the country. We also note some of the key factors affecting the retention of both early career and experienced teachers. These include the diversity of the school, relationships with the school leadership, and promotional opportunities.

As is the case for other countries, reviews of the composition of the teacher workforce in England have shown a persistent shortage of Black, Asian and other minority ethnic (BAME) teachers in relation to the minority ethnic student population (Steel, 2015; Haque, 2017; Haque and Elliott, 2017; Joseph-Salisbury, 2020). For example, in 2018, the proportion of minority students in primary education was 33.1% and in secondary 30.3%, whereas the proportion of teachers from ethnic minority origins was estimated to be 11.3% and 17.4% respectively (Gov.UK, 2020a, b). Table 1 shows that this overall student–teacher gap in state funded schools also exists for minority subgroups, as well as for the proportion of the corresponding working age population (with the exception of the White Irish group). Minority ethnic pupils therefore do not see themselves represented in the teaching workforce. Some disadvantaged students such as from Traveler, Gypsy and Roma backgrounds do not meet any teachers from their ethnic group, despite making up 7% of the pupils (Gov.UK, 2020b).

Beyond policy pronouncements about training more minority ethnic teachers to address shortages reflected in the headline figures (Whittaker, 2019), there has been little empirical investigation of how the racial/ethnic character of the English teaching force has changed over time, where BAME teachers tend to be employed, and what happens to these teachers once they are employed. These are important questions from the organizational point of view of teacher retention (Ingersoll and May, 2011) given the existence of evidence that nationally retention is lower for minority ethnic teachers (Allen et al., 2016; DfE, 2018) and that teachers from different minority groups experience unique problems in their careers (Haque and Elliott, 2017).

Guided by these concerns, our research (Tereshchenko et al., 2020) used the recent 2018 School Workforce Census and related administrative school census datasets to model the distribution of teachers from minority ethnic groups across English schools. To our knowledge, this is the first analysis of this kind, including a total of 21,746 schools. As part of this research we also conducted 24 narrative interviews with teachers from different ethnic and professional backgrounds to explore factors shaping their retention. At risk of overgeneralizing, the findings summarized below relate to non-White British teachers as a whole.

Where minority ethnic teachers work

The employment of minority ethnic teachers is not uniform across England. Our analysis showed that around 46% of schools in England had no teachers from minority ethnic groups. Only 16% of schools employed more than one in five teachers from minority ethnic backgrounds. The most influential characteristic of schools with a large proportion of minority ethnic teachers was the location of the school. On average around 35% of teachers in Outer London schools and over 40% of teachers in Inner London schools were from non-White British background, a far greater concentration than any other English region. The data indicate that 96% of London schools employed at least one non-White British teacher, twice the rate of schools outside of London.

Our linear regression model identified the factors associated with the likelihood of a school employing a large proportion of BAME teachers in schools across England, and, to account for a strong London effect, separately in London and non-London schools. The featured factors are listed in Table 2 in order of magnitude of association. The key finding is that the presence of minority ethnic teachers occurs in secondary schools with strong minority representation among other staff, including teaching assistants, non-classroom support and auxiliary staff. The ethnic background of staff also appeared to mirror that of students, as minority ethnic teachers were more likely to be found in schools with a high proportion of students from non-dominant racial and cultural backgrounds using English as an additional language (EAL). Notably, this pattern persists nationally, in London and outside of the capital city.

In addition to the strong associations related to diversity, we found that, nationally and outside of London, minority ethnic teachers were more likely to be working in schools run by the local authorities (LA) compared to academies. Within London, we also found some evidence that schools with a high proportion of minority ethnic teachers were more likely to be located in the areas of higher income deprivation affecting children (IDACI). These schools were rated lower for effectiveness of leadership and management by Ofsted (the chief inspection and regulation department responsible for inspecting educational institutions in England). We found some additional evidence which suggests that, in England, schools rated lower for overall effectiveness by Ofsted were associated with a larger proportion of BAME teachers. This is of concern given the importance of school context in teacher retention.

Table 1 Percentage of teachers, students and the working age population, by ethnicity.

	White British total	Minority ethnic groups						
		White Irish	White other	Black	Asian	Chinese	Mixed	Other
Students	65.4	0.3	6.7	5.7	11.4	0.5	6.1	2.0
Teachers	85.9	1.6	3.9	2.2	4.4	0.2	1.3	0.6
Working age population	78.5	1.0	5.7	3.6	7.5	0.9	1.8	1.1

Table 2 Descriptors of schools closely associated with a large proportion of BAME teachers.

England overall	London schools	Non London schools
1. High proportions of BAME teaching assistants	1. High proportions of BAME teaching assistants	1. High proportions of BAME teaching assistants
2. London location	2. High proportions of EAL pupils	2. High proportions of BAME non-classroom based school support staff
3. High proportions of BAME non-classroom based school support staff	3. High proportions of teaching staff who work part-time	3. Secondary schools
4. Secondary schools	4. High proportions of BAME non-classroom based school support staff	4. High proportions of BAME auxiliary staff
5. High proportions of EAL pupils	5. Secondary schools	5. High proportions of EAL pupils
6. High proportions of BAME auxiliary staff	6. Effectiveness of leadership and management is lower	6. Higher number of teachers in the leadership group (FTE)
7. LA maintained schools	7. Higher IDACI quintile	7. Free schools
8. Overall school effectiveness is lower	8. Higher proportions of full-time temporarily filled posts	8. LA maintained schools

What factors matter for staying

Focusing on the prominent diversity predictors cited above, teachers from minority ethnic groups tend to reside in high diversity urban areas in England. This may partly explain why these teachers gravitate toward diverse schools in their communities. However, there is evidence from a relatively dated teacher survey that minority ethnic staff in the UK express a *preference* for culturally diverse schools (Davidson et al., 2005). Our interviews also clearly indicated that minority ethnic teachers purposefully sought out diverse schools and enjoyed working there. A recently qualified Black male teacher told us: “I’ve basically said to my fiancé, I’m probably going to move out of London but I want to work in London, because of the demographics”. This comment refers to the student demographics and supports the literature around humanistic inclinations of minority teachers to make a difference in the lives of young people from low-income and culturally and linguistically non-dominant communities (Achinstein et al., 2010). The importance of staff diversity, alongside that of students, was also extremely important for many of the teachers. They linked more diverse school contexts to reduced “racial stress” in their professional lives with implications for retention (see Hancock et al., 2020). Of course, given that only 16% of schools in England employ a fifth or more of their teachers from minority ethnic groups, in the same urban schools where BAME teachers are disproportionately employed, the teaching staff overall is nevertheless predominantly White British. Yet, in the words of one newly qualified primary teacher, having even a small support network of colleagues “that look like me, having the same experiences as me” was key for her decision to move to a London school. The following statements from the interviews are representative of the other reflections on the importance of diversity:

I was at school today actually for my first day and you could just see everyone and they’re so friendly and it’s like majority Asian. There’s quite a few black people and it’s like “this is nice”.

Charlotte, Black African heritage.

They were actively saying, “We want our teachers to be reflective of our students.” The deputy head was, I think, Indian. The head teacher, I think she was from Eastern Europe, so it was very mixed. Actually I did enjoy my time at that school.

Olivia, Black Caribbean heritage.

So for me, when choosing a school, yes, it does matter what their culture is and how they view ethnic minorities and if you walk around on interview and don’t see that reflected in students or staff then I probably will be less likely to go and work there.

Farid, Asian heritage.

In alignment with a body of work examining the impact of organizational characteristics of schools on teacher retention, we found that although school demographic characteristics mattered to minority teachers, this was not enough to keep them in schools long-term. Relationships with the leadership team emerged in our study as being the main retention factor for these teachers, with all of our respondents referring to this element, regardless of the number of years worked and type of school worked in. Teachers wanted senior leaders to appreciate, respect, value and support them. This worked particularly well when school leaders had developed their racial literacy to enable a dialogue about ‘race’/ethnicity and equity in school, to support culturally relevant teaching, and to end stereotypical approaches to minority ethnic staff development (such as direction into pastoral roles). These interpersonal and professional qualities were critical for teachers perceiving a comfortable social environment to work in, having possibilities for establishing dialog with school leadership, resolving conflicts with colleagues, having the “freedom” to teach, their sense of self-esteem and even their salary.

Our interviews suggested that as their tenure progressed, teachers developed a particularly keen eye for discerning the place of white privilege in school power hierarchies. In this respect, we observed clear differences between respondents who were early career teachers and those who were experienced teachers. Those who had been in profession for over five years highlighted their concerns about barriers to getting rewards and promotions, making a lack of advancement the key retention factor for experienced teachers from minority ethnic groups. One Black interviewee linked disciplinary roles assigned to minority (and male) staff to their poor promotion record (see also [Hargreaves, 2011](#); [Haque, 2017](#); [Wallace, 2020](#)): “They’re constantly being given those same classes that nobody else wants to deal with but they’re not being given any sort of opportunity for progression to move up, because dealing with those kind of classes, it’s going to be harder for you to be a literacy coordinator or to be a numeracy coordinator or for you to be an arts coordinator, science coordinator, phase leaders, etc.” Notably in our research, teachers who had been in the school system for a number of years were successful in obtaining middle leadership roles. For some it took less than five years to secure mid-level leadership appointments such as heads of the year group and pastoral units, subject leaders, curriculum coordinators, but they then often felt stuck in those posts for years.

Many of our interviewees were firm in the belief that their racialized status prevented them from further career progression into what they perceived as all white, and predominantly male, senior leadership circles. This finding reinforces the claim by [Wallace \(2020\)](#) about “a diversity trap” existing for Black teachers in the UK whereby their inclusion “in entry-level leadership tracks may change perceptions of the power of Whiteness in schools and to wider publics, but does not change the institutional arrangements that preserve White privilege” (p. 359). Feeling unfulfilled and/or undermined in their effort to advance within schools, some experienced teachers we interviewed indicated, for example, that they had considered or were considering retraining as school inspectors, becoming a supply teacher or an educational consultant, teaching abroad, or doing a doctorate. The concerns expressed by our interviewees are reflected in the literature. An existing body of research has identified the underrepresentation of educators from minority ethnic groups in school leadership positions in England (see [Elonga Mboyo, 2019](#)). The emerging evidence from the US suggests that the presence of Black leaders in school decrease Black teacher turnover ([Bartanen and Grissom, 2019](#)). It would appear that the challenges of promotion and progression need to be placed on the policy agenda to mitigate the turnover and attrition of experienced and indeed other teachers from minority ethnic groups.

Conclusion

The overwhelming conclusion of research on the supply of teachers is that problems of minority ethnic teacher shortages are attributable to poor retention. Results of reviewed studies show the existence of several salient commonalities among factors affecting minority teacher retention in different countries. These commonalities include the tendency to work in urban, diverse and disadvantaged schools with additional pressures and unfavourable organizational conditions while having to navigate racism within the predominantly White teaching profession. Our case study conducted in England provided additional empirical evidence of the importance of diverse and inclusive workplaces for the retention of teachers from minority groups with the particular emphasis on staff diversity and equal representation on all levels of the school hierarchy.

Looking ahead, most literature on the retention of minority ethnic teachers focuses on the United States context. More research is required on the retention of minority ethnic teachers in England and other increasingly diverse countries in Europe. The lack of empirical studies using nationally representative data of what happens to teachers from nondominant ethnic group once they are employed and what drives their turnover makes it difficult to formulate policies around staffing urban disadvantaged schools with high quality teachers and retaining them. Such analysis could also help explore and potentially raise equity concerns with respect to the relegation of these teachers to schools with lower levels of various capitals. The trends must be examined within specific ethnic subgroups to account for different histories of disadvantage. Additionally, while common retention patterns across schools and across minority ethnic subgroups can be informative, there remains a gap in qualitative research on successful retention practices of minority ethnic teachers in specific schools. Much could be learned from documenting and disseminating successful and potentially transferable practices.

Introduction

Internationally, early career teachers have increasingly been framed as a “problem” that limits the provision of high quality education in schools (Sullivan et al., 2019b). Concerns have centered on how they can transition to the profession to assume full teaching roles just like more experienced teachers (Down and Sullivan, 2019). Extensive research has examined various induction practices, including mentoring, coaching, reduced workloads, and professional development, aimed at supporting early career teachers to successfully make this transition (see the review by Long et al., 2012). However, it is clearly understood that policy initiatives aimed at supporting early career teachers to transition successfully to the profession have largely been based on deficit views of them (Kelchtermans, 2019).

This chapter examines the international literature on teachers' work, particularly what we know about their work during the early career induction phase. Understanding the context and work of early career teachers is important especially because too few people are entering the profession and, worryingly, far too many teachers are leaving early (Sullivan et al., 2019a) especially during the current COVID-19 pandemic (Chrisafis, 2022; Rivers, 2022; Sainato, 2021; Shearing, 2021).

In this context, the chapter considers what can be done to reframe the work of early career teachers based on an alternative democratic imaginary of teachers' work beyond the limitations of neoliberal policy regimes and the constraints of performative cultures (Angus, 2012). We argue that early career teachers' work needs to be radically reconceptualized in ways that reflect the complexity, fragility, uncertainty, and relational nature of teaching (Connell, 1985; Lortie, 2002 [1975]). This involves an activist professionalism whereby early career teachers are viewed more as active agents or knowledge producers than mere deliverers and technicians (Ball, 2016; Sachs, 2003). This is a more participatory, collegial, and reflective response to the needs of early career teachers based on the values of trust, respect, and care. We deploy the notion of a critical learning community as a means of fostering this kind of vision whereby early career teachers can engage with the broader philosophical, democratic, and progressive purposes of education (Ayers, 2004; Dewey, 1944 [1916]; Thomas and Schubert, 2001). In this way early career teachers can engage with colleagues around contemporary issues of immediate relevance and worth to them. In these spaces early career teachers can begin to produce new knowledge about curriculum, pedagogy, and assessment practices. We conclude that there are unexpected and paradoxical consequences of trying to reframe early career teachers' work in the context of increased performativity and work intensification.

This chapter is organized around six key questions:

- What is the early career induction phase and why does it matter?
- Who are early career teachers and what is their employment status?
- What is happening to early career teachers and their work?
- What research has been conducted on early career teachers and the induction phase?
- How are early career teachers being supported, or not?
- How might early career teachers' work be reimaged?

What is the early career teacher induction phase and why does it matter?

The first few years of a teacher's career as they transition from pre-service teacher education into the profession is known as the “induction phase” (Kelchtermans, 2019). This phase is characterized by “hopefulness, energy and enthusiasm, a high degree of

motivation and commitment, as well as some new approaches to pedagogy and classroom management" (Johnson et al., 2016, p. 38). Research has identified the conditions under which early career teachers can thrive during this phase. For example, we know that consideration needs to be given to the broader policy environment, the school culture, the relationships that are formed, the work that they are expected to undertake, and the support given to teachers (Johnson et al., 2015, 2016). However, it is also known as a time when many new teachers experience stress and praxis shock, leading to teacher burnout (Clandinin et al., 2015; Lambert and Gray, 2021; Veenman, 1984). In most countries, early career teachers face unrealistic expectations that they will perform like more experienced teachers from the first day of employment (e.g., Johnson et al., 2016); their work is being increasingly de-professionalized (Down and Sullivan, 2019); and their employment conditions are declining (Preston, 2019; Sutherland et al., 2016). Of particular concern is the escalating levels of casualization and contractualization, which serve to undermine the notion of relational trust and a sense of belonging (Smyth, 2012). Research has examined the experiences of new teachers and identified that they are subjected to increasing pressures due to work intensification and performativity (e.g., Flores, 2019; Gewirtz et al., 2009; Johnson et al., 2016). More recently, research has identified that teachers experience high levels of scrutiny and surveillance, which leads to uncertainty about professional performance and a lack of agency (Perryman et al., 2017; Sullivan et al., 2021).

The threats to teachers' wellbeing and professional judgment have been well researched and have led to a range of attempts to support teachers during the induction phase. Kelchtermans argues that teacher induction should provide "purposeful support and guidance" to teachers as they learn the particular requirements of a school and facilitate student learning (2017) and, more broadly, that teacher induction is "the socialization of new members of the teaching profession in their job" (2019, p. 83). Kearney (2021) argues that "Induction in recent years has come to be an umbrella term for orientation, mentoring and support of teachers, both new to the profession and/or new schools (Wong, 2004) and has been linked to professional accreditation/registration" (p. 143).

Early career teachers are critical to the future of education and the teaching profession; therefore, there is an obligation to provide the conditions necessary to support them in times of uncertainty. If we wish to prepare children extraordinarily well for success in family, careers, and life, then the induction of early career teachers is essential. The importance of early career teachers is heightened by serious concerns about an international current and impending teacher supply crisis compounded by the COVID-19 pandemic (McGowan and Rose, 2022; Sullivan et al., 2019a; Wilson and Carabetta, 2022). Thus, understanding the ways in which new teachers can be supported during their induction phase is critical to their success.

Who are early career teachers and what is their employment status?

In order to understand what is happening to teachers and their work it is important to consider who early career teachers are and what their employment status is. The teaching profession continues to be composed mainly of women and it is widely recognized as a feminized profession (Moreau, 2019). Research shows that internationally men are less likely than women to consider teaching as a career pathway (Han et al., 2020). Moreau (2019) explains that the "overall proportion of women in teaching fluctuates considerably across segments of the teaching labor market with, however, women consistently concentrating in the less prestigious and (financially) less rewarding segments" (p. 9). This is illustrated in Australia, for example, where 96% of early childhood pre-service teachers are women, whereas 57% of secondary pre-service teachers are women, reflecting differences in status and pay opportunities (Australian Institute for Teaching and School Leadership, 2020). Furthermore, early career teachers are most likely to be women in their 20s (Australian Institute for Teaching and School Leadership, 2020).

The nature of the employment status of new teachers is changing. Firstly, teaching is becoming a profession in which people are increasingly employed on a part-time basis. For example, in Australia 27% of primary teachers and 20% of secondary teachers are employed part-time (Weldon, 2015, p. 13). Secondly, and of more concern, job security is becoming more precarious. The casualization of teachers' work is particularly affecting early career teachers. For example, the latest data in Australia shows that 60% of newly graduated teachers are employed on contracts of less than 1 year (30%) or as casual teachers (30%) and it can take several years to secure long-term employment (Preston, 2019). We know that early career teachers find their work incredibly demanding, but the demands are exacerbated for precariously employed teachers. As they transition into the profession, they are expected to do the same work as more experienced teachers with very little support. They embark on an extremely steep learning curve and find the work relentless. Early career teachers are doing this intense work under close scrutiny as they try to demonstrate that they are performing to a long list of teacher registration standards and, at the same time, vying for secure and ongoing employment (Sullivan et al., 2021).

What is happening to early career teachers and their work?

In a number of countries around the world, the reputation of teachers is not only being questioned but it has become highly politicized. For example, recently in the US, Donald Trump Jr. gave a speech to a crowd in which he stated:

I love seeing some young conservatives, because I know it's not easy. Keep up that fight. Bring it to your schools. You don't have to be indoctrinated by these loser teachers that are trying to sell you on socialism from birth.

Strauss (2019).

Reports indicate such attacks on teachers are occurring in other countries as well. For example, politicians in the Netherlands called on students not to put up with teachers who were brainwashing them in relation to climate change, in Hungary the government censored textbooks, and in Turkey teachers were sacked for allegedly having links to a political group (Strauss, 2019).

Such political statements and actions frame teachers as a “problem” and are aimed at creating derision and uncertainty in the broader public. Smyth and Shacklock (1998) state that such “incomplete views of social reality are constructed to serve particular political interests” (p. 70) and they draw on the work of Wallace (1993, as cited in Smyth and Shacklock, 1998) and Ball (2006) to label this as a “discourse of derision.” Unfortunately, public statements by powerful people continue to politicize teachers and their work. This politicization influences who is attracted into the teaching profession and how they do their work, particularly those teachers at the beginning of their careers.

Neoliberal and neoconservative political views of education are not new; rather they have been influencing teachers and their work for decades (Apple, 2001; Berliner and Biddle, 1995). Such views focus on individual and deficit perspectives of early career teachers in the context of concerns about the “quality” of teacher candidates, university initial teacher education programs, and falling student performance on standardized test scores. This perspective is disseminated in a range of “nation at risk” discourses encapsulated in national and international reports describing the deteriorating quality of teachers and teacher education, for example, the Carter Review of Initial Teacher Education in England (Carter, 2015), the Teacher Prep Review in the United States (Greenberg et al., 2014) and the *Action now: classroom ready teachers* report in Australia (Teacher Education Ministerial Advisory Group, 2014).

Ball (2006) argues that such views are intentional and aimed at undermining perceptions of the success of education systems to bring about more traditional approaches to schooling. Regular attacks on student performance, teacher quality, teacher education, academic standards, teaching methods, and school discipline occur in many countries around the world (Down and Sullivan, 2019). This provides fertile ground for a range of political remedies to “fix” the problem of incompetent and ill-prepared teachers by reasserting control over teachers’ work and focusing on traditional teaching methods such as scripted curriculum, testing, rewards and sanctions, behavior management, and explicit instruction (e.g., Donnelly, 2004). In the context of the wider “culture wars” (Shor, 1992) and “conservative restoration” (Apple, 1996), as well as ongoing debates about the so-called “literacy crisis” and teaching of Indigenous histories, these kinds of instructional strategies are neither innocent nor neutral. In this environment, therefore, it is very easy to slide into disparaging and demeaning public discourses about the declining quality of early career teachers and the profession more generally (Graham, 2015; Mockler, 2021).

Johnson et al. (2019b) describe this as a “negative macro policy environment which implicates early career teachers in the perceived decline in educational standards in developed countries” (p. 213) leading to a de-professionalization of early career teachers’ work and a lack of trust in the work early career teachers do (see also Down and Sullivan, 2019). This negative macro policy environment has led to increased levels of scrutiny and performativity, and spiraling work intensification for teachers, which has a significant impact on new teachers (Johnson et al., 2016).

In this policy environment, early career teachers face numerous personal and professional dilemmas, tensions, and conflicts (Bates and Townsend, 2007; Menter et al., 1997) as they “battle” to survive “in the trenches” (Bezzina, 2006) and navigate their way into the profession in circumstances not always of their own choosing (Johnson et al., 2015). They encounter a school environment in which centralized, top-down, command and control approaches lead to the deskilling and de-professionalization of their work (Bates, 2007; Clarke et al., 2000; Gewirtz et al., 2009; Gleeson and Husbands, 2001; Smyth, 2001). In short, teachers’ work is “over determined and over regulated” through unprecedented levels of accountability, regulation, surveillance, standardization, and high-stakes testing (Ball, 1993, p. 106).

What research has been conducted on early career teachers and the induction phase?

The issues related to early career teachers and their transition to the profession have been well researched. Research has documented and analyzed the challenges that early career teachers face as they transition to the profession and the conditions that support them during this phase. For example, forty years ago Veenman (1984) summarized the literature on the litany of problems neophyte teachers face as they confront the realities of school and classroom life. These include managing student behavior, motivating and engaging students, acknowledging and accommodating students with different abilities, planning appropriate curricula, assessing and reporting learning, interacting with parents, and satisfying external accountability expectations. More recently, Stokking et al. (2003) maintain that the problems that arise when early career teachers are expected to do this work as soon as they are appointed to a teaching position demonstrate that teaching is “simply too demanding” (p. 330). The transition from the relative comfort of university life to “the complexities as well as the full responsibilities of an entire classroom is for many early career teachers a confronting, challenging sometimes deeply disturbing experience” (Kelchtermans, 2019, p. 84).

Kelchtermans (2019, pp. 84–85) argues that there are “four different thematic lines” of research conducted on early career teachers. The first theme of research is individual teachers’ sometimes dramatic and traumatic experiences of “reality shock,” “transition shock,” or “practice shock” (Veenman, 1984, pp. 143–144) when the stark realities of teaching lead to the collapse of idealism and progressive beliefs formed during pre-service teacher education. Problems are manifested as “complaints about workload, stress, and psychological and physical” troubles (p. 144). This theme of research is very problem focused, individualistic, and classroom oriented.

The second theme is the challenges associated with developing “professional relationships with diverse other individuals and groups (colleagues, principals, parents) in the school, with different interests and expectations” (Kelchtermans, 2019, p. 85). This invariably involves negotiating the micropolitics of school life (Johnson, 2004; Johnson et al., 2019a) by developing “micropolitical literacy” (Kelchtermans and Ballet, 2002a) that enables early career teachers to learn to deal with “issues of power, influence and control” (Kelchtermans and Ballet, 2002b, p. 755) as they strive for recognition as competent and valued professionals.

The third theme is teacher attrition and retention and is the most frequently discussed and researched. It is well documented in many countries that the loss of early career teachers to the profession is a profoundly wasteful and threatening trend that will exacerbate looming teacher shortages (Sullivan et al., 2019a). The focus of much research on early career teachers, then, is on the ways to better support them to stay in the profession (e.g. Clandinin et al., 2015; Lavigne, 2014; Long et al., 2012).

The final research category draws on all three former themes but centers on specific strategies within formal teacher induction programs designed to support newly qualified teachers, principally through various forms of “mentoring.” In these arrangements, experienced teachers support novice teachers by providing orientation guidance, information about the school and its culture, explicit coaching, and emotional assistance. A significant body of research documents the most important aspects of early career teacher induction programs and strategies, to which we now turn.

How are early career teachers currently supported, or not?

A considerable amount of research has been undertaken into the induction of early career teachers. Making sense of a large body of research has been made easier by a number of timely reviews of the field over the past 20 years (Frederiksen, 2020; Hobson et al., 2009; Howe, 2006; Ingersoll and Strong, 2011; Long et al., 2012; Schaefer et al., 2012; Strong, 2005; Wang et al., 2008). These reviews have synthesized numerous studies of teacher induction in diverse contexts with the aim of producing “evidence-based” strategies that best support early career teachers’ transition to the profession. For example, in her “review of reviews,” Frederiksen (2020) provides a thematic analysis of seven previous reviews that examined the findings of over 330 studies of the induction process in primary and secondary schools “with their various content and contexts” (p. 49). We present insights from these reviews under the following headings: Aims of Induction Programs; Common Strategies and Components Used in Induction Programs; The Role of School Leaders in Induction Programs; The Influence of School Culture on Induction Programs; and Mentoring.

Aims of induction programs

As we discussed earlier in the chapter, the most common justification for initiating early career teacher induction programs is based on deficit views of graduate teachers; the belief that they lack the knowledge, skills and experience needed to be “classroom-ready teachers” (Down and Sullivan, 2019) and are therefore in need of remedial interventions from their more experienced and competent colleagues. Induction programs based on assumptions of ineptitude feature structured supervisory observation of teaching to identify and rectify teaching skill deficiencies, co-planning activities to ensure that curriculum and lesson preparation are “adequate,” and regular performance appraisal meetings to confirm compliance with school and system requirements (Johnson et al., 2019a, p. 117).

Deficit-based induction programs have been stridently critiqued by researchers (e.g., Kelchtermans, 2019) and school leaders who endeavor to “construct an alternative narrative about early career teachers that speaks against traditional deficit-oriented portrayals” (Johnson et al., 2019b, p. 214). These researchers and leaders recognize the strengths of early career teachers – their enthusiasm, energy, and willingness to innovate to “address the changing needs of twenty-first-century learners” (Johnson et al., 2019a, pp. 108–109), and the fact that they “represent rich networks and bring valuable ideas and practices to the school” (Kelchtermans, 2019, p. 94). Induction programs based on a strengths approach seek to invest in the ongoing professional development of early career teachers. The early career teachers in Johnson et al. (2019a) study received systematic, coordinated and strategic professional development opportunities as part of their induction to ensure that they contributed in positive ways to the achievement of their schools’ aims.

Common strategies and components used in induction programs

Research into early career teacher induction has identified a wide range of activities that are usually presented as lists of “positive things to do” to support early career teachers (Davenport, 2009; Frederiksen, 2020). It is worth noting, however, that most research into early career teacher induction focuses on teachers who are employed on long or ongoing contracts when, in many countries, many beginning teachers are employed on insecure, short-term, and tenuous contracts (Preston, 2019). Given this caveat, the components of “good” induction programs identified across many reviews (Frederiksen, 2020; Hobson et al., 2009; Howe, 2006; Ingersoll and Strong, 2011; Long et al., 2012; Schaefer et al., 2012; Strong, 2005; Wang et al., 2008) include:

- conducting a comprehensive initial orientation to the school
- planning a long-term induction program spanning 2–3 years

- providing instructional support
 - sharing curriculum and teaching materials
 - implementing mutual lesson observations
- establishing collaborative working arrangements
 - team teaching
 - co-planning curricula
 - forming network groups with peers (early career teachers and more experienced teachers or “mentors”)
- modifying work arrangements
 - reducing workload
 - providing extra release time (e.g., to write student reports)
 - de-privatizing early career teachers’ work by creating physical spaces that promote and enable teachers to collaborate more
- promoting teacher agency
 - seeking teachers’ views about their induction needs
 - offering choices about induction activities
- monitoring performance
 - observing and providing feedback on classroom teaching
 - structuring regular “performance review” meetings
 - encouraging reflective practices.

The role of school leaders in induction programs

School leaders have a pivotal role in developing early career teachers’ professional competencies and commitment. Focusing explicitly on the micropolitical work of school leaders (Blase and Bjork, 2010), Johnson et al. (2019a) identified the strategies they use to develop and retain the teachers they want:

They modify early career teachers’ work arrangements to reduce their isolation, promote their involvement in collaborative teaching arrangements and reduce their workload by providing extra release time and shared curriculum resources. ... [T]hey invest heavily in developing early career teachers ... by encouraging their involvement in formal professional learning activities, publicly recognising and rewarding their contributions and providing opportunities for future leadership. (pp. 118–119)

Understanding the way in which school leaders can structure and influence the work of early career teachers is complex, but important. School leaders are responsible for establishing the conditions that enhance the retention of quality teachers in their school (Schleicher, 2012), but systems are responsible for establishing such conditions across schools.

The influence of school culture on induction programs

Closely linked to school leaders’ micropolitical work is research into the impact of school culture and school context on the professional development of early career teachers. Frederiksen (2020) summarizes four of the reviews she examined that address the role of school culture in teacher induction:

These four reviews indicate that new teachers have very different opportunities to develop professionally, depending on school culture. The effect of the teacher induction program depends on the social, cultural and organisational context in which it is situated. ... [A] supportive, interested and encouraging management team is identified as a key factor in developing an open, collegial and collaborative school culture. (p. 60)

However, early career teacher induction can be “undermined if there is poor leadership and a non-conducive culture at the school, with a lack of ... professional communities” (Frederiksen, 2020, p. 61).

Mentoring

As Orland-Barak (2016) points out, “mentoring” is the most common label given to a suite of induction support strategies for early career teachers. Kelchtermans (2019) argues:

Most support initiatives for early career teachers encompass some sort of mentoring, in which a senior, more experienced teacher (the mentor), engages with novice colleagues (the mentees) by providing different forms of assistance, including information, coaching, technical training and moral and emotional support. (p. 85)

While there is considerable debate in the literature about the efficacy of mentoring (see Kardos and Johnson, 2010), Hobson et al. (2009) and Shockley et al. (2013) have identified the following features of positive mentoring arrangements (summarized by Frederiksen, 2020, pp. 57, 62):

- The mentor needs to be trained for the role.
- The school culture needs to value and support collegiality and cooperation between staff.
- Mentors are given extra time to prepare and perform their mentoring role.
- Mentors and mentees meet during school time.
- Mentors and mentees collaboratively plan induction activities and scheduling.
- Both mentors and mentees have access to other supports in the school beyond the mentor relationship.

How might early career teachers' work be reimagined?

While many of the above initiatives are welcome and even useful, they are insufficient to address the wider structural and institutional arrangements in which early career teachers find themselves. In this final section, we wish to advance some alternative ways of thinking about early career teachers' work and induction processes. In this task, we endeavor to progress a *democratic* teacher-driven approach which attempts to address some of the shortcomings of existing explanations of early career teacher quality and what might be done about it. We argue that it is timely to shift away from the limiting effects of management pedagogies, and instead think anew about what it means to teach. This involves creating a more participatory, critically engaged, and activist approach to early career teacher induction. In other words, we want to imagine early career teachers' work in ways that begin the process of reclaiming and reimagining the democratic purposes of education (Apple and Beane, 2007; Dewey, 1944 [1916]). In pursuing this task, we find the idea of a "critical learning community" useful because the "indigenous knowledge" of teachers is valued, trusted, and respected (Nieto, 2003; Sachs, 2003; Sergiovanni, 1994; Smyth, 1998; Wenger, 1998). Here, early career teachers learn to work together and sustain the conditions necessary for learning (Day, 1999; Nias et al., 1992). They have ownership and agency over their work including curriculum, pedagogy, and assessment, and are seen as valuable contributors to ongoing school improvement (Day et al., 2006; Day et al., 2006; Hargreaves and Fullan, 2012). Behind this empowering approach to teacher professionalism is a commitment to building both individual and collective capabilities, which Sen (1992) defines as those "valuable functionings that make up our lives, and more generally, our freedom to promote objectives we have reasons to value" (p. 3). Central to this broader project is the "quality (the 'well-ness', as it were) of the person's being" (p. 39).

Thomas and Schubert (2001) expand on this bolder vision when they describe three main anchor points of teaching beyond the current fetish with standards and management pedagogies. First, teachers should be "engaged in philosophic inquiry," that is, "investigating the value assumptions of their students, their colleagues, and their own metaphysical, epistemological, and axiological convictions" (p. 234). Second, teachers need to develop as "democratic connoisseur[s]" or "critical interpreters of existent curriculums and creators of new curriculums, novel forms of instruction, and appropriate methods of assessment" (p. 235). Third, teachers should see themselves as "progressive activist[s]" committed to "democratic practice understood as ... public advocacy for social policies that attempt to redress injustice and public criticisms of state actions that oppress or institutionalize inequality" (p. 235; see also Ayers, 2004; Freire, 1998).

There are numerous ideas and strategies available in the literature to support this kind of transformational work, for example, "teachers as intellectuals" (Giroux, 1988), "teachers as knowledge workers" (Kincheloe, 1993, 2001), "activist teacher professionals" (Sachs, 2003), "teachers as policy actors" (Ball et al., 2011; Gale and Densmore, 2003), "teachers as cultural workers" (Freire, 1998), and "becoming a critically reflective teacher" (Carr and Kemmis, 1986; Kress, 2011; Smyth, 2021). Giroux (1988) explains in a little more detail how

teachers as intellectuals will need to reconsider and, possibly, transform the fundamental nature of the conditions under which they work. That is, teachers must be able to shape the ways in which time, space, activity, and knowledge organize everyday life in schools. More specifically, in order to function as intellectuals, teachers must create the ideology and structural conditions necessary for them to write, research, and work with each other in producing curricula and sharing power. ... As intellectuals, they will combine reflection and action in the interest of empowering students with the skills and knowledge needed to address injustices and to be critical actors committed to developing a world free of oppression and exploitation. (p. xxxiv)

While these emancipatory ideas have been around for some time, the challenge of questioning the dominant ways in which teachers' work is organized is fraught with difficulties and resistance (Diem and Helfenbein, 2008). Said (1994) explains how the process of conservatism in the profession is maintained as teachers "become tame and accepting of whatever the so-called leaders in the field will allow" (p. 57). As a result, the "moral agency" of teachers and their identities is threatened because "praxis demands creative thinking, care, compassion, and critical consciousness – thinking outside or beyond the box" (Kemmis and Smith, 2008, p. 5).

If we are serious about changing the conditions under which early career teachers work, then it will require profound changes in the ways in which schools and school systems are organized, led, and imagined (Gale and Densmore, 2000; Goodlad et al., 2008). In the Australian context, for example, Johnson et al. (2016) identify six important practices necessary to building a more democratic school culture:

- engaging teachers in participatory democratic decision making;
- promoting a sense of connectedness and belonging to place;
- encouraging a spirit of collective ownership, responsibility and solidarity;
- developing awareness of agency and power to make a difference;
- building a culture of collaboration, innovation and risk taking; and
- producing professional knowledge based on the concerns of classroom teachers (p. 140).

At heart, therefore, is an awareness that “another [kind of] school is possible” (Wrigley, 2006). This raises questions about whether another kind of education system is possible, one based on the values of critical inquiry, social justice, democracy, compassion, care, and respect for all. In these schools, in the words of Freire (2007 [1974]), “people [teachers] develop their power to perceive critically *the way they exist* in the world *with which* and *in which* they find themselves” (p. 83). Early career teachers flourish in schools (and systems) where they are encouraged to conduct local investigations into the conditions and circumstances in which they (and their students) find themselves (Kelchtermans, 2021; Loughran, 1999). In the words of Kress (2011), this involves

breathing new life into research methods for teachers [in a way that] requires scholar-practitioners to develop critical consciousness about who they are in relation to their students and the larger society [whilst] conducting research that is fair, ethical, and empowering for all stakeholders. (p. 10)

However, as Connell (1985) reminds us, schools are workplaces in which the “political order” reflects “the pattern of authority and consent, alliance and co-operation, resistance and opposition that characterize the institution as a whole” (p. 131). Unsurprisingly, early career teachers flourish best when they are invited to participate in reciprocal and horizontal learning relationships in which their knowledge, expertise, and energy are valued (Johnson et al., 2014, 2016). In this sense, schools are deeply relational places in which early career teachers begin to make sense of themselves, their context, and what it means to teach (Day and Gu, 2014). How early career teachers can do this across multiple schools remains uncertain.

Of course, this is a lot to expect of early career teachers and involves a degree of personal and professional discomfort in terms of the emotional “dark side” (Brookfield, 1995) of undertaking critical self-reflection including questioning some deeply entrenched assumptions, values, and beliefs about teaching. Nonetheless, Brookfield (1995) believes there are five major benefits to be gained:

- It helps us take informed actions.
- It helps us develop a rationale for practice.
- It helps us avoid self-laceration.
- It grounds us emotionally.
- It enlivens our classrooms.
- It increases democratic trust (pp. 22–26).

Yet, there is a widespread political and popular view that teaching is not complex work, and that it can be reduced to a list of standards which are identifiable, calculable, and transparent, and thus more rigidly controlled and scripted (Fitzgerald and Savage, 2013). In contrast, a democratic approach to early career teacher induction draws attention to the complexity and fragility of teachers' work (Lortie, 2002 [1975]), as well as the emotional demands of the job (Connell, 1993, p. 63) and the centrality of critical learning communities in supporting early career teachers.

Acknowledgments

This paper is an outcome of the Early Career Teacher Resilience and Retention Study (LP0883672) and the Retaining Quality Teachers Study (LP130100830), both funded by the Australian Government through the Australian Research Council Linkage Scheme. The Early Career Teacher Resilience and Retention Study also received funds and/or in-kind support from eight education sector organizations in South Australia and Western Australia. The Retaining Quality Teachers Study received funds and in-kind support from the Principals Australia Institute. Note: the views expressed in this article do not necessarily reflect any of these educational organizations' policies.

Introduction to coaching for teacher development

A frequently heard adage is that teaching is not rocket science, it is harder than that. Keeping 25–30 students with different interest and abilities engaged in productive learning lesson after lesson in schools is not an easy task.

Then there are parents, colleagues, administrators, and politicians who expect teachers to go above and beyond what is often reasonable to expect. Consequently, in many countries today teachers feel powerless in front of these external expectations. Declining job satisfaction and even burn-out have made many teachers to decide to leave teaching (OECD, 2019). Initial teacher education providers in most countries have difficulties recruiting smart, motivated people into their teacher education programs. In the United States and Australia, for example, there have been significant declines in these enrolments during the past decade. Even in countries where teaching has previously been an attractive career choice for young people, more experienced teachers are leaving the teaching profession for growing dissatisfaction and less young people consider teaching in school as a competitive career option.

There is no silver bullet that would fix the challenges the teaching profession is facing around the world. One important part of the solution is to develop initial teacher education so that it is akin to ways other professionals, medical doctors, lawyers, and architects, for example, are educated. In this chapter we will focus the other part of the solution that would help newly educated teachers in the early part of their teaching careers to get engaged in and remain committed to teaching in their first schools. This includes different practices of induction, mentoring, and coaching, which can be critically important in retaining qualified, passionate teachers in schools.

Based on our recent research and evidence for the current knowledge base we argue, that investing in early career teachers systematically through induction and professional learning that includes school embedded coaching can have a significant positive impact on teacher's professional growth, motivation levels and contribute to retaining beginning teachers in schools.

Coaching as part of professional learning and induction of teachers has been researched and practiced since the 1980s (Cox et al., 2014; Showers and Joyce, 1996; Whitmore, 2009). Yet, there is no universal definition or practice of coaching, that makes also the research of coaching complicated. What is considered coaching by one person might mean mentoring to another. In one school, coaching may mean improving teacher practice, student learning, and wellbeing. In another coaching may mean developing school culture and its organisational functions.

It is important to decide the purpose of coaching when selecting or designing a coaching program for a school. While there are many practices and definitions of coaching, teacher development professionals agree that coaching often sits on a continuum of a more directive and less directive stance (Downey, 2003; Parsloe and Leedham, 2009; Passmore and Sinclair, 2020). Facilitative coaching, instructional coaching, and mentoring are often identified on this continuum. The less directive stance of a facilitative coach, according to Whitmore (2009) does not teach but rather helps people learn and unlock hidden potentials and opportunities to professional growth.

The following examples of coaching practice are common in contemporary professional and research literature on teacher development and school improvement.

1. *Instructional or Teacher Coaching* focuses on improving quality of teaching and students' learning through regular one-to-one coach-teacher sessions in school. Instructional coaching have found to have positive impact of the quality of teaching. For example, in Kraft et al. (2018) meta-analysis of 60 studies of teacher coaching programs found larger positive effects on teacher instruction and smaller positive effects on student achievement. The University of Kansas Center for Research on Learning (2022) and Jim Knight (2007, 2009, 2011, 2018, 2019) have studied instructional coaching, communication, and other forms of professional development for over twenty years reporting similar findings.
2. *Mentoring and coaching* are situated on a continuum and designed to meet educators at their point of need. Rachel Lofthouse at the Carnegie School of Education at Leeds Beckett University directs CollectivEd: The Mentoring and Coaching Hub (2022)

where she connects professionals, academic and students with shared interests. [Hollweck and Lofthouse \(2021\)](#) and [Lofthouse \(2019a,b, 2014, 2013\)](#) has studied mentoring and coaching in practice and developed ways to support the implementation of coaching within schools ([Lofthouse et al., 2010](#)).

3. *Cognitive Coaching* is a professional learning process where teachers examine the thinking behind their practice. It emphasizes the development of teachers as self-directed learners with dispositions for lifelong professional learning ([Costa and Garmston, 2015](#)). Through self-management, self-monitoring, and self-modification, the cognitive coaching approach aims to increase an individual's potential for self-directed learning.
4. *Positive Psychology Coaching* is "a managed conversational process that supports people to achieve meaningful goals in a way that enhances their wellbeing" ([van Nieuwerburgh and Biswas-Diener, 2021, 315](#)). As an academic, researcher, executive coach and consultant van Nieuwerburgh is interested in the integration of coaching and positive psychology in education and health settings ([van Nieuwerburgh, 2014](#)). Another example is Coaching Psychology developed by Anthony Grant ([2018, 2011, 2014, 2016, 2021](#)) who has also led evidence-based approaches to coaching in the workplace, with executives and organisations.

In the next section we provide a more detailed conceptual description of the key terminology related to coaching early career teachers.

Induction, mentoring, and coaching in teachers' professional development

When new graduates in other professions enter their first workplace, they often get support in their early careers through various mentoring programs or internships. This is not always that case in education and teaching has become an increasingly complex profession. OECD's Teaching and Learning International Surveys ([2014, 2019](#)), for example, clearly show the lack of consistent and well-developed professional support for early career teachers. Early career teachers' experiences and professional growth depend on many variables, but a sharp increase in the continuation of learning or professional growth is an expectation. In addition, once accredited, educators are often required to provide evidence of professional learning for the maintenance of teacher accreditation. Common elements, according to [Darling-Hammond et al. \(2017\)](#), of effective professional learning include coaching, expert support, and time for feedback and reflection. But still today many teachers start their teaching careers without adequate guidance. Coaching would give them a stronger start and probably impact their adaptation into schools.

There has been positive progress in many countries during the past three decades to provide early career teachers with opportunities of support from trained and experienced coaches and proficient teachers, while also affording opportunities for reflection and feedback. "Sink or swim" is the metaphor often used to depict a teacher's first few years of practice ([Glazzard and Coverdale, 2018; Howe, 2006; Varah et al., 1986](#)). In many countries that have less-consistent professional scaffolds for new teachers, up to half of these early career teachers leave the profession before they finish five years of teaching ([Darling-Hammond et al., 2017](#)).

Supporting teachers with specific induction programs can have a positive impact on beginning teachers ([AITSL, 2016; Hay-Group, 2014; Ingersoll and Strong, 2011; Ramsey, 2000](#)). However, the induction process design is inconsistent and unregulated nationally and internationally ([Craven et al., 2014; OECD, 2018, 2019; Paniagua and Sánchez-Martí, 2018](#)). Offering a fresh perspective, early career teachers need support, guidance, and a degree of agency, as they bring current pedagogical knowledge, technological awareness, and enthusiasm to the school context.

Schools today increasingly develop induction policies and programs to support beginning and experienced teachers who are new to the school. It is vital for school leaders to create a collaborative culture in a positive working environment to build beginning teachers' resilience, improve efficacy, and develop a sense of belonging ([Gu and Day, 2013](#)). While induction programs promote teacher quality and job satisfaction ([Ingersoll and Strong, 2011; Paniagua and Sánchez-Martí, 2018](#)), the inconsistency is evident, as professional and emotional support is insufficient for some early career teachers ([Gallant and Riley, 2014](#)), and isolation and frustration is experienced ([Buchanan et al., 2013](#)). Programs and processes designed to encourage teacher professional growth must eliminate these levels of frustration and generate more satisfaction in the teachers' nascent years.

Mentoring is an important part of induction programs, and the terms induction and mentoring are frequently used synonymously ([Ingersoll and Smith, 2004; Long et al., 2012](#)). Mentoring and coaching are commonly viewed as one supportive structure situated on a continuum ([Downey, 2003; Parsloe and Leedham, 2009; Passmore and Sinclair, 2020](#)) and often identified collectively as coaching. Quality mentoring or coaching programs are essential to support early career teachers ([Mercieca, 2018; Riddle, 2015](#)), as these programs build teacher and teaching capacity ([Barkley and Bianco, 2010; Knight, 2009](#)). Frequently fixated on the deficiencies of beginning teachers ([Martinez, 1994; März and Kelchtermans, 2020](#)), educators, schools, and authorities need to identify and build on their strengths.

Coaching and mentoring as strength-based approaches both seek to support the professional learning of others through a one-to-one conversation and are anchored in a collaborative and reflective relationship where the focus is on personal and professional growth. Various professions and organisations view both differently and definitions are often blurred. Mentoring programs are designed to support early career teachers ([Ingersoll and Strong, 2011](#)), however, mentoring is employed differently for varied purposes ([Kemmis et al., 2014](#)). For example, in Australia and Finland, varying models of mentoring exist within induction. [Kemmis et al. \(2014\)](#) found that schools implement mentoring to either supervise, support, or assist teachers in self-development by collaborating with others. In mentoring, a more experienced person guides professional learning through conversations ([van](#)

Nieuwerburgh and Barr, 2017). Both mentoring and coaching aim to support growth through conversations but mentors distinct from coaches, require and draw on their expertise. Effective educational programs differ depending on the context and purposeful intent.

To capture the interconnection of coaching and mentoring, Hollweck (2017) designed a mobius strip (Fig. 1) illustrating an educators first few years of teaching.

As we stressed earlier, it is vital in the initial stages to determine how coaching (or mentoring) is defined in the specific context, and the purpose of program. Teachers are more likely to embrace a program if its purpose is well-defined and the process transparent.

The purpose of mentoring varies widely from developing management skills and supporting career transition to the socialization of new staff (Joo, 2005), while the primary purpose of coaching in education focuses on improving student learning and wellbeing through teacher professional development and self-awareness (Grant, 2006; Van Nieuwerburgh et al., 2021). When the focus is on improved student learning and wellbeing outcomes, selecting either teacher learning, student learning or both is imperative when initiating and evaluating a coaching program. Similarly, for measured effectiveness, improved wellbeing needs to target either teachers, students, or both. Coaching also has other benefits to teachers and schools. It can improve teachers' communication skills, develop deeper engagement in school improvement, and advance collaboration among staff, or support a more inquiry approach into their practice.

According to Joo (2005), another difference between coaching and mentoring is coaches frequently use structured processes, strategies, tools and techniques (Cox et al., 2014; van Nieuwerburgh, 2014). Schools or systems of schools (e.g., school districts, networks or clusters) often design processes and templates for their specific context and purpose and use various frameworks that initiate cycles of improvement or scaffold conversations. In contrast, mentoring is often an individual request or an acquisition of knowledge where the results are less tangible and more personal.

In teacher development, as Hollweck and Lofthouse (2021) note that in education there is no one right way to coach. They suggest that customizing to the learning environment and contributing further to the context, is critical in designing effective coaching programs. Aligning a purposeful evaluation process as part of coaching programs provides data to inform, improve and refine the practice. Embedding a coaching program requires school funding to train coaches and schedule coaching sessions.

Subsequently, funded initiatives often demand evidence to illustrate the benefits gained from the investment. Specific tools such as teacher surveys or student achievement offer consistent and current feedback. As an embedded coaching program becomes an iterative process, ongoing evaluation, check-ins, and feedback are necessary. Consistent change occurs in schools with mandated

Fig. 1 Mentoring and coaching during teacher induction. The interconnection of coaching and mentoring by (Hollweck, 2017). Reprinted from Hollweck, T. (2017) Threading the needle: examining the mentoring and coaching fellowship of the western Quebec school board. In: Kutsyruba, B., Walker, K.D (eds.), *The Bliss and Blisters of Early Career Teaching: A Pan-Canadian perspective*. pp. 205–226, Word & Deed Publishing. Burlington Ontario.

requirements, curriculum modifications, staff turnover, and the growth and learning progression of all learners, including staff and students. Therefore, the coaching program should adapt and evolve to the contextual needs.

While mentors draw on their prior professional expertise, coaches need to be cautious of providing expert advice, as this often confuses the relationship and shifts the power dynamics and stance. In a more directive stance, a mentor supports through knowledge transfer, as the more experienced person. In a less directive stance, [van Nieuwerburgh \(2012\)](#) argues that a coach supports the person to develop self-awareness and responsibility. There is a difference between taking responsibility and taking advice. [Whitmore \(2009\)](#), p. 37 argues that “If advice is given by the coach and it fails, blame may be placed on the coach.” The coach’s advice is exchanged for the coachee’s responsibility, and this is not an optimal outcome. Furthermore, if the coachee blames themselves for the failure, self-efficacy may be affected. However, both stances and approaches are appropriate, as the early career teacher may be unconsciously incompetent. At times, beginning teachers don’t know, what they don’t know.

As a powerful conversational intervention, coaching supports teachers to accomplish better results for the organisations and for themselves ([van Nieuwerburgh, 2014](#)). [Cox \(2016\)](#) notes that a coach aspires to build on strengths and broaden perspectives. Additional professional learning is an anticipated precedent for all beginning teachers, but schools also need to tap into the resources beginning teachers possess, as they bring additional strengths to the school context.

Depending on the purpose, coaching can have different forms, for example cognitive, executive, psychological, solution-focused, facilitative, and instructional. In contemporary theory and praxis, coaching is often classified into three conversational approaches, facilitative, instructive, and directive. Although there are no commonly agreed definitions of coaching ([Knight, 2018](#); [Ryan and Deci, 2019](#); [van Nieuwerburgh, 2014](#)), some common threads emerge when observing various definitions used in literature. For the purpose of this chapter, the following definition of coaching can be derived from the current literature and practice:

Coaching is a confidential one-to-one collaborative process that focuses on developing learning and wellbeing through increasing knowledge, skills, and self-awareness, while providing a sense of choice, competence, and connection.

Available knowledge base of coaching in school context reveals nuances that are relevant to the context of teacher development. For example [Whitmore \(2009\)](#) emphasizes the concept of coaching as unlocking people’s potential, while [van Nieuwerburgh \(2012\)](#) highlights the coaching skills of questioning and actively listening, as well as the importance of teachers’ self-directed learning. If this learning is self-directed, the coach is the decision maker and has agency. [Tschannnen-Moran and Tschannnen-Moran \(2011\)](#) describes coaching as a way of being that evokes motivation and actions in people through conversation. Teacher autonomy and professionalism are paramount in effective coaching for teacher development.

Based on early literature on coaching (e.g., [Rogers, 1980](#)) coaches require attributes such as humility, respect, integrity, care, and confidence in one’s ability to coach, and confidence in the potential of the coachee ([van Nieuwerburgh, 2014](#)). The coaching way of being ([van Nieuwerburgh, 2014](#)) aligns well with the philosophy of the Partnership Principals ([Knight, 2011](#)) that include attributes that promote effective interaction, such as equality, choice, voice, dialogue, reflection, praxis and reciprocity. [Stringer \(2020\)](#) notes that through coaching, reciprocity of learning occurred for both the coach and coachee. Collectively, these dispositions of a coach are essential for an effective coaching relationship.

In the coaching way of being, the coach needs to believe in the teacher’s ability to achieve the goal ([van Nieuwerburgh et al., 2019](#)). By extending this to include the coachee’s self-efficacy or sense of competence, reciprocity of belief in achieving the goal is then accomplished ([Ryan and Deci, 2019](#)). Coaching encompasses a focused conversation drawing on various coaching skills such as active listening, skillful questioning, paraphrasing, and summarizing and providing feedback ([van Nieuwerburgh et al., 2019](#)). Training to develop these skills, knowledge and characteristics is favourable. Educators with a shared understanding of coaching comprehend the expectations, the process, and the personal and professional benefits for them and their school community.

Finally, coaching programs can be formal or informal and may incorporate contracts or agreements, coaching frameworks, allocated time, coaching qualifications, and other supportive documentation. The coaching frameworks that schools often adopt identify the type of coaching embedded within the school and provide information about the coaching purpose and practice. Again, the importance of purpose, implementation and practice come into essential play, as the stance within a coaching cycle may transfer from more directive to less directive, depending on the knowledge, skills, and experience the beginning teacher brings to the conversation. When coaching early career teachers, there are times when it is required to share expertise and knowledge. Instead of telling the early career teachers what works best, suggestions made may be accepted or rejected, implemented or not. Intrinsic motivation, that is a cornerstone of school cultures in Finland ([Sahlberg and Walker, 2021](#)), for example, can be sustained when suggestions or options originate from the early career teacher, while still meeting their professional or personal needs.

Often the professional needs of an early career teacher may suit the well-organized framework of teacher or instructional coaching. This draws on [Bandura’s \(1989\)](#) theory of observational learning to improve educators’ self-perceptions of competence by watching instructional delivery. Identifying the purpose, positioning coaching in the school’s strategic plan and allocating provisions is pivotal when embedding a coaching program, as it provides clarity. The alignment of the coaching purpose, implementation and practice should be transparent and understood by all stakeholders. The program’s effectiveness is evaluated based on the purpose and practice of coaching, and these data provides a baseline for this reiterative process. Coaching programs should not be identical but contextual; as all contexts differ, learning environments change, and all learners’ needs consistently vary.

Australian case study: coaching early career teachers

The power of coaching lies in its potential to provide professional and personal support to teachers in their early careers. By understanding specific coaching practices applied within a school, leaders and coaches can adopt, adapt, or even disregard techniques, frameworks, and tools according to their context and professional needs. While advancing conceptual and practical coaching knowledge in the school context, it is important to acknowledge the influential factors that motivate and nurture early career teachers as self-determined learners. Coaching supports a sense of choice, competence and connectedness, and self-determined learners grow and flourish when their psychological needs are met (Ryan and Deci, 2019). As processes and conditions can undermine or facilitate self-motivation, the learning environment or context is pivotal.

We recently conducted a study in New South Wales in Australia to find out how to support early career teachers for the development of their professional knowledge and skills in teaching. In addition to professional growth, the support incorporates the best approach to sustain and nurture teachers' motivation levels, while providing a sense of choice, competence, and belonging. More specifically, our study examined how the purpose, implementation, and practice of coaching that we discussed above influenced early career teachers' professional growth that included both their professional learning and wellbeing. Using qualitative methodologies, we investigated how different people perceive coaching in schools, how coaching is organized and embedded within each school, and what or who motivates early career teachers to continue to learn and grow professionally.

Just like in many other countries, not much is known about the role of coaching in Australian schools. While Mansfield and Gu (2019) conducted research in Western Australia to investigate the professional learning activities of early career teachers, and the perceive impact of these on their professional development, our study explored coaching early career teachers for professional growth. The aim of our study was to advance the conceptual and practical knowledge of coaching by interpreting the perception, implementation, and practice of coaching early career teachers for professional growth.

The shift from mentoring to coaching early career teachers for professional learning transfers the stance from more directive to less directive. Many view coaching as a dialogical partnership and sharing collegial experience for professional growth and impact. The coach does not give advice but offers options and choices, nourishing autonomy.

We included three different purposefully selected schools in this case study to portray differences and similarities, existing in Australian education sectors, namely Independent, Catholic, and government school sectors. The diversity across these three schools provides an opportunity to learn about the complexities of implementing coaching in various schools. The school location, sector in which it belongs, and level of schooling are the identified variables in our study.

The range of variation regarding the coaching program and how they were implemented in different schools was unknown from the outset. The composition of the three schools consisted of one secondary (Years 7–12) and two K-12 schools located in rural, suburban, and urban settings in New South Wales, Australia. These schools provide an in-depth description of how the purpose, implementation and practice of coaching influence the professional growth of beginning teachers. Here is an overview of the initial findings in this study.

Purpose of coaching is clear but is not the same among school

The schools in this case study explained that coaching focused on either learning or wellbeing, whether it be teacher or student, and could be a combination of both. Coaching outcomes contributed to the positive learning environment that incorporated a belief in educators, research, and coaching, while being committed to a collaborative culture, where learning and adapting to challenges developed. Argenta School (school names are changed) introduced teacher coaching with the goal of supporting teacher learning and wellbeing. It has since expanded the focus to include teachers coaching students. The capacity for teachers to coach students has seen an amplification in this school. Therefore, an increase in the allocation and training of coaches for students resulted. However, the allocation of one coach for teachers remains unchanged.

At Argenta, many teachers are trained as coaches and take a "coaching approach" to their conversations around professional development plans and yearly goals. This is not a formalized coaching session per se, but a coaching approach that utilizes transferable elements of coaching (Campbell and van Nieuwerburgh, 2018). The principal of the Argenta calls coaching a "bit of an octopus" with many legs, and it "sort of evolves." She maintained that the coaching program is responsive, and you must be strategic about what is working and what is not working. Purely optional, the teacher-coach provides formalized coaching, while other trained coaches take an informal approach to determine yearly goals for professional learning plans. Other trained coaches work formally with students on their learning goals.

The second school that we call Banksia initially focused on teacher learning, yet extended its coaching program to include teacher wellbeing and made coaching available to all non-teaching staff employed by the school. The coach at the third school, Columbus, focused solely on teacher learning with the goal of improving student outcomes. While the program has evolved, the interviews revealed that in the future, the purpose might include teachers coaching peers, and coaching to support teacher wellbeing. All three schools heightened the implementation of coaching based on feedback provided from school-initiated surveys or focus groups or both. With the increased investment, the purpose of coaching extended to either include additional focus areas or funded more release time for coaching and training.

Principals position coaching in the strategic plan so that it typically lies with the leadership and coaching team. All three principals had utilized and advised that research is needed. To understand the purpose of implementing coaching, principals asked what

problem they were trying to solve and if coaching could be the answer. Consequently, the coaches and teachers needed to comprehend and exemplify the purpose in similar ways. The Columbus principal claimed, “If teachers do not feel they need coaching, it will take a long time get off the ground”. Argenta School principal stated, that “You can’t have flourishing students without flourishing teachers”. The Columbus principal proclaimed, that “Coaching empowers teachers to accelerate and amplify their impact on student learning”. Common views among these school leaders were that coaching makes good teachers into great teachers and harnesses the experience of others to leverage their development in particular areas of perceived need.

Comparatively, the purpose of coaching varies in these three schools, yet each school had a program with a clear purpose. We found that each coaching program was contextually designed around what was needed, and the needs evolved. Coaching serves multiple purposes, including teacher learning, teacher wellbeing, student learning, student wellbeing, while also influencing the school culture. How a school implements coaching may change and adapt due to the meaningful feedback from teachers, coaches and even students.

Coaching is an investment to professional capital in school

It was evident that principals had considerable influence over the implementation of a coaching program. For coaching to succeed, allocating funds for school embedded professional learning is pivotal. Expenses associated with implementing a coaching program include training teachers to become coaches and allocated release time for coaches and teachers. An overwhelming barrier for many schools is manipulating timetables to afford the time to coach. There is a cost to replace teachers from face-to-face teaching for either training or coaching sessions. The availability of casual teachers is also an issue. Making provisions for training coaches requires an allocation of time and funding, whether delivered in-house or by an outside commercial provider. The assumption that an expert teacher equates to an expert coach is a concern. All schools shared the importance of training coaches and using criteria for selecting coaches, as an effective coach requires interpersonal and professional skills, and associated dispositions. Coaching incorporated into the strategic plan elevates coaching into a high priority position.

Two of the three schools emphasized the importance of including the coaching program into the strategic plan, and when designated as a priority, coaching becomes strategically resourced. The principal from Columbus School shared that although their priorities are strategically resourced, a strategic plan is not required. He viewed strategic plans as too slow for the current era, and stated, “With a commitment to entrepreneurial thinking, our approach is to ensure the vision is well known and that decisions about learning and care are future thinking focused, data informed, and action research based”.

Typically, when integrated into the strategic plan, the principal allocates funds and establishes an evaluation process to determine the program’s effectiveness. In all schools, the evaluation process evolved to reflect a coaching program that continually developed to reflect the contextual needs and recent research. Some may view the evaluation as a form of accountability, driven by the system. Nevertheless, the principal and leadership team believed in the efficacy of the coaching program for the investment was significant, and the objectives long-term. The importance of how coaching builds on or supports already established programs was evident. The three schools did not align with one commercial program or coaching philosophy, with each program being agile, bespoke, and contextual to meet the individual school’s needs.

While perceived as a worthwhile investment, coaching demands school time and funding. Principals, coaches, and teachers all commented on the scarcity of time. This challenge is a constant tension not only with coaching but with everything that goes on in schools. The coaching process requires allocated time for coaches and teachers within busy school days. Columbus School principal stated, “Time is the greatest investment we can make in all our teachers”, and he schedules time to participate in coaching conversations. He argued that if coaching is going to be a priority, principals need to be a part of that priority, and it is one way of “connecting with what is happening at the grassroots”. Banksia School principal stated, “We’re sitting within the body of research that suggests equipping teachers is vital, and coaching teachers is a valuable instrument in that purpose”. A critical component in this coaching investment is the time the coaching program takes to mature. All three schools had embedded coaching for at least two years, while most schools for many more.

All the schools declared their coaches received training. Two schools sought training from an outside provider and explained the importance of consistency. However, both lead coaches in those schools continue to personally upskill their coaches to extend their knowledge, practice, and skills. Columbus welcomed two staff members who were previously trained over numerous years as instructional leaders. Their knowledge and experience contributed to the expansion of the coaching program. Along with the principal, these staff members delivered professional learning by facilitating an in-house coaching program that drew on their experiences and research. This course reflected the importance of consistency and clarification around the purpose and practice of coaching. These provisions reflect the purpose of coaching, with training being fundamental to the implementation of coaching that allows for coaching to be put into action.

Coaching in action

Argenta School had a less directive stance in coaching, also known as a facilitative approach to coaching. This facilitative approach places the goal purely at the coachee’s discretion. The sole teacher-coach relies on coaching expertise more than teaching expertise.

When examining the collected data on coaching goals, the teacher-coach recently developed three themes: teachers' effectiveness in their role, a future career focus, and work-life balance.

During the Australian bushfires and floods, and the disruption of teaching and learning due to COVID-19, the overwhelming theme in teacher development was work-life balance. According to the teacher-coach, a teacher shared that she "feels as if coaching is a gift, she is giving herself". The coach explained that she denied a couple of teachers who had left the school for various reasons as, they "actually asked if they could still be coached". She expressed that she believes that coaching, long term, would have an impact on retaining teachers at the school. While the purpose of coaching at Argenta was about the "whole person", the teacher-coach is interested in moving from a purely facilitative approach to a more instructional or teacher approach, as she views it as a blend of mentoring and coaching. The teacher-coach articulated her awareness of the expenses associated when adding another component to coaching and questioned the possibility.

The Banksia School did not classify the coaching program as instructional and preferred their coaches to be recognized as GROWTH coaches, who take a less directive stance. A facilitative coach does not need expertise in the area when coaching. Nevertheless, the school identifies their coaches as expert teachers. They have coaching that focuses on teaching and learning while providing their staff autonomy throughout the coaching cycle. Coaching is mandatory for all early career teachers for one year, with time allocation provided by the school. Some may identify tension in the idea of the directive stance of expert teachers versus the less directive stance of an expert coach.

Banksia School exemplified the coaching continuum. When needed, the expert teacher shared their expertise by providing options, yet holds judgment. This school has strategically embedded coaching for more than five years, with the program evolving throughout the years. It also highlighted the importance of staff wellbeing and the learning environment with the lead coach sharing how they support and deeply care for their staff and invest in coaching because they know what works. The Banksia principal discussed losing beginning teachers and how the prevailing perception is due to pay and working conditions. He said, "Often, in the past, it's been sink or swim" and a "lack of in-school support for emerging teachers". According to the lead coach in that school,

We know it [coaching] doesn't just have impact on student outcomes, but it has an impact on your wellbeing, and has impact on your professional expertise, and your professional growth. And it also allows you to then have the confidence to contribute back to our community in a professional manner.

A teacher leaving Banksia School expressed to her coach that "it's a shame I can take you with me. I would really love to be able to keep doing this [coaching]". The coach voiced how teaching is a "long haul", and that we are witnessing more teachers drop out early in their careers. She shared her wonder of whether a fortnightly coaching conversation could help retain more employees while also benefiting students.

The Columbus School also had a coaching program that evolved, but the purpose has not changed. According to one coach, the principal is genuinely committed to the coaching model and resources and has a sharp vision and understanding of learning for all. The power in this coaching model lies within the responsive approach by the leaders and the inclusion of all voices in decision making. At Columbus, coaching is mandatory, and the leaders declared that coaching is a huge part of the school. It is purely focused on teaching and learning and concentrates on data and evidence to demonstrate its effectiveness.

At Columbus, there appeared to be some tension between the need to focus purely on teacher instruction. One coach shared that while we are all working toward the same goal of improved student outcomes and teacher practice, a teacher is more than their instructional routines. It was articulated that coaching could include goals such as developing organization and conversational skills. Another coach maintained that the difference between a coach and an instructional leader is that coaching establishes relational trust and identifies teachers' strengths first. She expanded on her comments maintaining that coaching involves the heart, with practices such as empathy and trust. Motivated by wanting teachers to stay in this profession, this educator found her "niche" in coaching. While the program has evolved, the interviews revealed that the purpose might someday include teachers coaching peers and coaching to support teacher wellbeing.

In each school, whether the goal is learning or wellbeing, the coaching process identified components within frameworks or models that provided structure and guidance while ensuring reflection. The coach's dispositions or "way of being" were identified characteristics demonstrated by the coach to build a trusting relationship. Faith in others, confidence and experience, ability to care for and develop others, approachability, empathy, gratitude, humility, and integrity were highlighted as characteristics of the coaches. The learning environment appears to strongly influence the experience and expectations of beginning teachers. The coaching programs reflected the concept of contextual coaching (see [Valentine, 2019](#)).

Lessons for teacher development through coaching

Learning new teaching strategies is an essential part of professional growth of early career teachers. As the evidence from the three schools above shows, coaching is more about stepping back and looking at the bigger picture, as beginning teachers often get caught up in the day-to-day of teaching. Early career teachers find coaching sessions helpful, they understand the importance of peer support and coaching, and how reflective processes strengthen collective autonomy at school. When teachers engage in coaching

voluntarily, their motive is autonomous. If we want beginning teachers to grow and learn professionally, then there is a need to view and support them as self-determined learners.

For the early career teachers, their students were a strong motivational influence, along with their colleagues, especially within their own department. Many of these teachers think they themselves are the primary source of motivation, especially those for whom teaching was not their first career. Most of the beginning teachers in our case study shared how the first few years are a combination of proving and improving yourself as a teacher. If early career teachers fail to be intrinsically motivated, it increases possibility of teaching becoming an unsatisfying profession. Working as a temporary teacher influenced the need to prove themselves, with one beginning teacher sharing that she was all about proving herself, her worth, and her value. Reassurance and recognition from coaches and colleagues, and strengths identified built early career teachers' confidence and competence.

All stakeholders in the professional learning process must hear the voices of the beginning teachers when determining the role of coaching for professional growth. Early career teachers mostly viewed the purpose of coaching as a process that improved their teaching and learning. Their motivation was strongly influenced by a positive learning environment that provided coaching.

Professional growth was achieved through a coaching partnership that was based on trust and required constant reflection. Within this dialogical partnership, the coach provided emotional support to set a clear path to achieve the self-determined goal that can be critically important regarding teacher retention. Coaching empowers individuals to develop positive and optimistic situations.

With the alignment of purpose, implementation, and practice, it is necessary to determine, develop, or borrow tools, models, and frameworks. The schools included in our case study produced several contextual resources by incorporating or adapting various available frameworks and altered some tools, templates, and processes to suit the ever evolving or expanding needs of their school. The coaching approach reflects the purpose and the implementation and practice follow. Coaching requires teachers to have additional skills and dispositions that is reflected in selection criteria. Confidentiality and trust were considered to be vital in coaching.

So, does coaching help teachers and schools to do better? While the schools struggle to show evidence of the impact of coaching on student learning, all consistently endeavor to achieve this. There appears to be tension between the type of data collected, as some strive for the elusive quantitative data. One participant stated that the impact of coaching on student learning is not always evident and not as noticeable as the impact on teacher practice. The theory of action reasons that improving teacher practice will improve student learning. For each school, external validation through surveys, school visits, reports and university partnerships became a vital component to confirm coaching effectiveness within their context. While each school has processes in place to determine the effectiveness of coaching, all aligned with their purpose.

Overall, the purpose of implementing coaching is often about student and teacher learning or wellbeing, or both. Well-designed and resourced coaching supports teachers' professional development and contributes to the positive learning environment. Notably, all the schools mentioned the importance of developing, retaining, and supporting beginning teachers and the positive contribution effective coaching makes to education.

Introduction

The complexity of teaching makes it both a challenging and rewarding profession (Kincheloe, 2008) so everyone connected with early career teachers has a part to play in inspiring “a sense of confidence, resilience, and self-efficacy” (Waddell, 2007: 125). My own research (Gordon, 2020a) focused on how initial teacher education provision might foster resilience among early career teachers. Clearly, this is only ever a starting point on the professional journey and should contribute to career development pathways for teachers in the longer-term, as noted by Gu and Day’s (2013: 40) comment that “teacher educators need to become engaged in future thinking with pre-service students on internal and external factors which influence resilience in teachers, so that they are better prepared for the realities of teaching.”

The connection between early career teaching and resilience is of interest to everyone in education as we respond to the global challenges of teacher recruitment and retention (UNESCO, 2017). In their early years in the profession, teachers face high levels of work-related stress (Vesely et al., 2014) and must respond to a range of complexities in the school environment as well as an ever-changing educational context (Howes and Goodman-Delahunty, 2015).

Against this backdrop, resilience is one matter among many pertinent to professional satisfaction, motivation and longevity in the profession. The chapter opens with an overview of literature related to early career teaching and resilience, beginning with definitions of resilience. Five key themes are then explored—purposefulness, confidence, social support, agency and culture—as central to the resilience of early career teachers. Specific examples from England and Australia are given to illustrate key points that may be transferable to other global contexts around the world. The voices of early career teachers appear in italics throughout.

Resilience

There has been increasing literature about teacher resilience, closely linked to wellbeing, ranging from research-informed articles (Gu and Day, 2013; Farrell, 2016) to practical guidance for teachers (Cowley, 2019; Holmes, 2019). Challenges of definition abound with resilience often described simply as “bouncing back” in the face of adversity. Other definitions see resilience as a dual quality, being both “resistant” and “elastic”. Whatever definition is used, there is an acknowledgment that resilience can be learned and developed over time, as it is both “improvable and teachable” (Zolli and Healy, 2012: 4).

Although it is widely accepted that resilience can be developed, there remains considerable uncertainty about the concept. Neenan (2009: 3) refers to resilience as “intriguing yet elusive” and Chandler (2014: 46) describes resilience as “an increasingly ubiquitous concept”, and Thom (2020:14) specifically addresses the school context and the “elusive and underexplored quality of resilience that is the secret ingredient all teachers need in order to survive in our profession.” As highlighted by Grotberg (1995), the transformative potential of resilience as we grow more as a result of life’s experiences is a characteristic of the concept.

Drawing on my own research with early career teachers over many years, I am at ease with the notion of “secret ingredient” but have come to a more nuanced understanding of resilience as a continuum, with toughness and determination at one end, and with vulnerability and openness at the other end. This is in part because different aspects of resilience are required at various stages of the professional journey which are more complex than simply “bouncing back” which could be considered a reductionist definition of resilience. Moreover, for the transformative power of resilience to thrive, it is important to note that a “multi-faceted construct like resilience requires a multi-faceted approach” (Cooper et al., 2013: 95) and an intentional, “deliberate cultivation of resilience” (Lucas et al., 2013: 12). For this reason, all those involved in early career teacher development should be aware of key factors which have the potential to hinder or enhance resilience.

Hargreaves and Fullan (2012: vx) define “professional capital” in teaching as the combination of human, social and decisional capital, which includes resilience as a key dynamic. In this regard, as different forces mediate the professional lives of early career teachers, it is important to recognize that resilience is not a final goal, but something to develop throughout professional lives and it may be more helpful, as Chandler (2014: 47) suggests, to “approach resilience as a way of thinking about how we think about the being of being.”

Early career teachers face “transition trauma” (Johnson et al., 2014: 531) and many professional demands, dealing with complexity and unpredictability on a daily basis. On occasions, this can be overwhelming as the experiences may contrast with their preconceived notions of the role (Kelchtermans, 2017; Sabar, 2004). A growing resilience may be needed to thrive in the profession in the longer term, including through pivotal transition phases in the early stages of the profession (Gordon, 2020b).

Nurturing early career teachers as they enter the profession is essential (Allen and Sims, 2018) as robust education systems around the world require experienced teachers. Attrition among early career teachers is detrimental to the educational enterprise, leading to fewer experienced teachers, including those who may aspire to leadership roles, and reduced stability in the learning environment for children and young people. While Smith and Ulvik’s study (2017) in Norway illustrates that we can recognize proactive choice and agency to leave the profession as a sign of resilience, a lack of experienced teachers (those with more than five years of teaching) will have a negative impact on student outcomes (Day and Gu, 2007). Hence, this chapter explores some of the key factors that nurture resilience to encourage early career teachers to stay and thrive in profession.

There is a need to be cautious, even vigilant, about a possible commodification of resilience as a construct, noting Kincheloe and Berry’s (2004: 98) encouragement to be alert to the “silent and invisible ways that power operates via structures, narratives, and meta-narratives to constrain our understandings of the world.” This chapter does not intend to promote resilience above other teacher qualities but rather to explore the potential impact of resilience on the wellbeing and effectiveness of early career teachers.

Mindful, then, that the literature identifies a number of dimensions affecting teacher resilience, including personal, relational and organizational dimensions (Gu and Day, 2007), this chapter explores purposefulness, confidence, social support, agency and school culture, insofar as they influence the ability of an early career teacher to be resilient. The impact of positive mentoring is noted as a decisive factor and indeed emerges as something of a leitmotif throughout the chapter.

Purposefulness

Central to resilience is a clear sense of purpose which, for many teachers, can provide motivation and passion throughout their professional lives. This notion is echoed in the writing of Zolli and Healy (2012: 7) who describe resilience as “the capacity of a system enterprise, or a person, to maintain its core purpose and integrity in the face of dramatically changed circumstances.”

Almost all participants in my research with early career teachers highlighted a strong sense of purpose, enthusiasm and energy at the start of their teacher education program: “*My life has purpose again!*” was a typical response from an early career teacher. This positive attitude at the outset is perhaps unsurprising among those who have made a deliberate career choice to enter the teaching profession. The key challenge is that of maintaining such positivity over time when some of the felt burdens of teaching can become overwhelming.

As part of my research inquiry, early career teachers engaged in creative writing activities at various stages of their teacher training program (Gordon, 2020a), providing deep insights into the emotional aspects of their experience. This haiku poem, written by one participant at the mid-point in the final school placement, captures many of the sentiments of other early career teachers:

A train on a track
Can’t go back, can I go on?
I’ll do it but how?

The sense of purpose for this early career teacher remains, but is being tested by the relentless movement of the train (and, by inference, the early career teacher) on the journey toward its destination. In some ways, the haiku signals the potential loss of personal voice and agency, as the individual is drawn along by an external, pre-determined force. The feeling of pressure is tangible, as the early career teacher struggles to cope. The development of teaching skills takes time and is never a linear process, posing a challenge to resilience at particular moments. Implicit in this haiku is a tacit acknowledgment, or even an acceptance, of the constant demands and challenges of teaching. There is also a hint of self-sacrifice (Thom, 2020) in the haiku and this may challenge a teacher’s resilience; the early career teacher needs to know when to seek support and guidance. If the environment and support around an early career teacher are positive, progress should be smooth, but there is no sense that these factors are present, and so the nurturing of this particular early career teacher’s resilience is jeopardized. The haiku poem echoes Hargreaves and Fullan’s (2012) suggestion that teachers’ commitment and effectiveness are particularly

challenged at the start of their careers which may lead to missed opportunities with regard to teacher retention and longer-term impact on learners' progress.

A strong sense of purpose is vital, not just at the start of the teacher journey, but throughout a teacher's career. Day et al. (2006: 8) note that teachers' effectiveness is "mediated by: ... the extent to which teachers sustain their commitment (i.e., are more resilient)." In a similar vein, Hong (2012) notes that students' needs are most effectively met when taught by a positive teacher with a clear sense of professional purpose and confidence.

Confidence

An early career teacher's reflections offer an entry point for considering the importance of confidence, reflecting that:

resilience, confidence, work-life balance and so on are all big issues for early career teachers. I have often thought that getting off to a good start early on in a career, and feeling successful early on, is really important and can make or break a career. Given the stresses and extremely high learning curve in teaching, I think this is particularly relevant.

Early career teachers have access to numerous books about surviving in teaching (Allies, 2021; Cowley, 2019; Holmes, 2019) and about teacher stress (Galton and MacBeath, 2008), as well as articles and blogs on professional wellbeing. It is perhaps unsurprising that early career teachers in my research regarded teacher resilience as more aligned with "coping" rather than a developmental process leading to personal and professional growth. Particular capacities emerge as related to confidence—dealing with uncertainty, autonomy and agency, reflective practice and mentoring support—but confidence is identified as a key aspect of early career "coping" and preparedness for, and early success in, the profession.

The identification of resilience with coping may be in part because the early career teacher occupies a liminal space, no longer protected by the structure and support of the initial teacher education program and not yet able to draw on a significant level of teacher experience. This lack of a professional hinterland poses difficulty in times of uncertainty or in responding to "contested issues" (Carter, 2015: 8) and the early career teacher can become reactive in the face of the inevitable disruptions that are part of a teacher's daily life (Britzman, 2006). Since effective education systems need experienced teachers to enable children and young people fully to progress (Ingersoll, 2002), it is essential that early careers teachers are nurtured and valued to be able to deal with "both push and pull factors" (Newton, 2021: 43) of professional experience. This is particularly important in contexts where negativity around the teaching profession is prevalent and where the "drip-drip effect of professional intent is eroded" (Newton, 2021: 37). Increasing prescription in terms of curriculum content in some countries, combined with a performativity culture (Ball, 2003), may lead to feelings of powerlessness and loss of professional autonomy (Sullivan et al., 2019) for the early career teacher who needs to be able to navigate this complex landscape with an ever increasing level of confidence.

The importance of reflective practice is closely linked to the confidence of early career teachers as they navigate what Schön describes as the "wampy lowlands" (1983: 42) of professional practice. The links between reflective practice and agency are well-rehearsed (Hargreaves and Fullan, 2012; Korthagen et al., 2001; Ward and McCotter, 2004) as early career teachers explore issues and broaden their understanding of their work. Developing as a teacher is more than becoming a compliant technician and includes the need to expertly employ pedagogy, develop subject knowledge, set realistic targets for development, draw on research evidence, and prioritize high levels of self-awareness as an early career teacher (La Velle and Kendall, 2021).

Appropriate training and support are essential in building confidence and, by extension, resilience of early career teachers around the world (Van Nuland et al., 2021). My own research highlighted the impact of negative feedback on the confidence of early career teachers, for example: "(I)t affected my confidence and I began to question my capabilities" and "No matter what I do, it won't ever fully satisfy the expectations of my mentor." In contrast, the overwhelming value of positive and constructive mentor relationships emerged as crucial in terms of fostering and nurturing the resilience of an early career teacher in the initial stages of a school placement. This metaphor from a participant in my research illustrates the power of a mentor to redress a lack of confidence in the early stages for an early career teacher:

... like your way up to the (bungee) jump where you feel like you can do it, but the higher you go the more the doubts creep in about your ability to jump. Then you jump and it's exciting and dangerous. Then near the end of the jump you feel the tug of the safety cord, you know you are going to survive and, even though there are still more ups and downs, confidence is higher and you can really start to just enjoy the jump.

Social support

Furlong and Maynard's comment (1995: 195) that "the quality of the next generation of teachers will, in large part, depend on the quality of the mentoring they are given" continues to have resonance. Indeed, in England, there is a renewed emphasis on high-quality, sustained mentoring in the Core Content Framework (DfE, 2019a) for initial teacher training and the Early Career

Framework (DfE, 2019b). Effective mentoring is a necessary aspect of support for the early career teacher, minimizing feelings of vulnerability and stress. Mentoring has the potential to reduce the risk of attrition in the early stages of a teaching career as new teachers feel supported to remain in teaching for the medium and longer term (Ingersoll and Strong, 2011). Well-structured mentoring is of particular value where early career teachers are dependent on short-term contracts and leaders are “reluctant to invest time, energy or resources in induction programs” (Farrell, 2016: 13). Such a lack of support for early career teachers with temporary contracts was noted in Australia (Gordon, 2020b), adversely affecting new teachers’ sense of belonging and professional progress. It should also be noted that mentors of early career teachers deserve appropriate training, recognition and time for their work (Mackie, 2020), not least as one early career teacher noted: “While I have ... a supportive department, I feel that everyone is so busy that there isn’t enough time to clarify my various (endless) queries!”. Any lack of mentoring time for the early career teacher has the potential to undermine resilience and lead to professional dissatisfaction and attrition in teaching.

In this context, Kelchtermans’ description (2009: 265) of vulnerability as a “structural characteristic of the profession” is significant. Although effective mentoring is necessary for early career teacher development, a key feature of being resilient is having the assurance to ask for help when needed, recognizing that learning and growing as a new teacher requires a patient and pro-active approach (Day et al., 2011). An effective mentoring relationship is two-way which means that early career teachers should be agentic and take ownership of their professional development. For teachers to develop resilience, “they need to be empowered and trusted” (Thom, 2020: 183), knowing that support and challenge is on hand.

One aspect of social support that is perhaps underdeveloped in the literature about early career teacher development is the importance of communities of practice (Wenger, 1998) where teachers have the opportunity for collaborative development. Hargreaves (1995) lists numerous benefits of professional collaboration, including social and moral support, increased efficiency and effectiveness, sharing of professional wisdom, continuous learning and opportunities for deeper reflection. Cordingley and Crisp (2021: 140) explore the impact of professional learning in global contexts on retention in the profession, noting that the relationship between the two is “complex and non-linear,” requiring encouragement, time, dialog, patience, and space to effect positive change.

In many countries, early career teachers are encouraged to join professional subject-specific associations, providing opportunities to learn, explore and share fresh ideas with other teachers, often working in a different context, thereby reducing the risk of professional isolation or stagnation which can happen even in a large and vibrant school. However, this may be overwhelming for primary early career teachers in particular who are faced with many subjects, and so more generic networks and communities of practice may be more beneficial in the early stages.

Organizations such as The Chartered College of Teaching in England prioritize support for early career teachers. This support includes information deriving from contemporary research, strategies for managing workload, insights about teaching approaches and an encouragement to be connected in order to shape the future of the profession, thereby building social and professional capital. Such professional communities of practice are necessary, as they foster “teachers building resilience together” (Younie and Preston, 2021: 79). As noted by Fletcher-Wood and Zuccollo (2020), well-structured continuous professional development has potential in influencing retention in the profession. Supportive networks enhance the sense of professional development, well-being and satisfaction for early career teachers.

Agency

A further important aspect of resilience is being able to think and act flexibly, to adapt in the face of new or challenging situations, and to develop professional agency and autonomy through the early years in the profession. This aligns closely with the idea of self-efficacy (Bandura, 1982; Biesta, 2020). Garvey et al. (2014: 112) highlight the need for teachers to have “strong and stable personalities and to be able to tolerate complexity” and Neenan (2009) reminds us that people are likely to develop resilience by stepping out of their taken-for-granted frames of understanding. Given this context, it is concerning that a sense of teacher agency and autonomy are under-developed among early career teachers (Worth and Van den Brande, 2020) and may lead to loss of professional satisfaction for an individual or a de-professionalized profession more broadly. The reasons are perhaps unsurprising, noting Philion and Connelly’s (2004: 468) observation that early career teachers “want answers and methods. They want to be certain, to know; but certainty does not generate the flexibly inquiring attitude required by learning.”

Accepting one’s mistakes with a positive mindset, using them to learn, is a vital part of being resilient, where early career teachers make uneven progress in their development as a teacher. Learning to adapt and take control of circumstances is essential for early career teachers as they respond to the flow and inevitable uncertainties of being a teacher. These skills lie at the heart of Gu and Day’s (2013: 26) argument that teacher resilience is: “not primarily concerned with the capacity to ‘bounce back’ or recover from highly traumatic experiences and events but, rather, the capacity to maintain equilibrium and a sense of commitment and agency in the everyday worlds in which teachers teach.”

As noted earlier, the importance of reflective practice for early career teachers is well-documented (Schön, 1983; Pollard, 2018; McGregor and Cartwright, 2011) and must be nurtured and encouraged as an integral part of an early career teacher’s practice. This is more nuanced than the requirement to “reflect systematically” as noted in the Teachers’ Standards in England (DfE, 2012: 6) as such mechanistic language loses the richness engendered by deep thought, critical engagement with literature about teaching and learning, and collaborative work with others over time. At its best, reflective practice prompts all teachers, including early career teachers, to think differently, to adapt, to re-frame, to take ownership and, above all, to develop agency in their work.

Johnson et al. (2015: 103) capture the power of reflective practice at the heart of early career teacher resilience, noting that it allows for “the emergence of a robust teacher identity.” A reflective approach minimizes the risk of authority-dependence, not in a confrontational sense, but rather in the spirit of transformational agency.

One reflection by an early career teacher, comparing her experience as a teacher to an orchestra conductor, serves as a powerful illustration of the importance of agency. Indeed, a sense of the joy of teaching may often be overlooked as central to a teacher’s resilience:

While I had been learning much about rhythm, one essential thing was missing. That is the beauty of the music. This beauty might have been missing because so much focus was put on rhythm, counting the beats, respecting the pause, which are all important elements in an orchestra of this size. By now, I knew that what I would be looking for when putting together my own orchestra was beauty above all.

Constraints on agency and possible solutions must be considered. Feedback from my own research participants cited the performativity culture of initial teacher education as a particular challenge—“every move is watched,” “so many people to please” and “death by targets” were common themes. One research participant reflected on the overall system, “I wonder if a better long-term approach would be to look at why teaching requires such extreme amounts of resilience and think of ways to improve the situation.” This situation may be less acute in other countries than England, where prescriptive Teachers’ Standards (DfE, 2012) need to be evidenced to gain qualified teacher status. The climate of prescription and compliance in England is unlikely to improve with the introduction of the ITT Core Content Framework (DfE, 2019a) with its requirements for early career teachers to “Learn that ...” and “Learn how to ...” across key areas of professional learning. Against this backdrop, the importance of school culture and support from mentors and school leaders cannot be underestimated, as they will add the much-needed personalized support to foster early career teacher resilience.

Culture

There is ample evidence to suggest that “conditions count” (Gu and Day, 2013: 22) in relation to teacher resilience and the ability to manage complex interactions in the shifting worlds of early career teachers. A sense of belonging among early career teachers is nurtured by positive working conditions (Skaalvik and Skaalvik, 2011), both physical and social. However, it is the broader school culture and leadership, including mentors, which have an even more profound effect on professional wellbeing, particularly regarding relationships which have the power to sustain commitment and promote resilience among early career teachers (Peters and Pearce, 2012). This echoes Luthar and Brown’s (2007: 947) premise that “relationships lie at the ‘roots’ of resilience ... the presence of support, love, and security fosters resilience in part, by reinforcing people’s innate strengths (such as self-efficacy, positive emotions and emotion regulation).”

A positive school culture is created over time, intentionally, by the senior leadership team in collaboration with all colleagues. It is vital for everyone’s voice to be heard and valued, for colleagues to feel trusted and energized in their work, leading to professional satisfaction (Cowley, 2019). Such an approach must include early career teachers who must be valued as colleagues and require a positive environment in which to grow and flourish.

The renewed focus on the importance of professional mentoring in many countries is to be welcomed. Indeed, a well-supported mentor relationship which encourages critical reflection, including uncertainty, may paradoxically strengthen the early career teacher when faced with varied demands and expectations. As noted earlier, there is need to move beyond a formulaic, “tick box” approach to reflection, and this applies equally to the mentoring relationship. The real significance of the mentoring relationship emerges from the bespoke approach to individual early career teachers, exploring their experiences and emotions to gain valuable insights into how to support them more effectively than any “one size fits all” prescriptive approach is likely to achieve. It is well-considered collaborative approaches by an expert mentor that build professional knowledge and skills, as well as nurture the resilience and self-esteem of early career teachers (Lofthouse, 2018).

Creative approaches to reflection as part of the mentoring relationship may prove beneficial in this regard. As Clandinin and Connelly (2000: xxvi) note, “(s)toories lived and told educate the self and others.” Herein lies perhaps one of the biggest challenges for the profession—how to create sufficient time for mentors to engage with the early career teacher to complete prescribed mentoring tasks and nurture and empower the new teacher in their care. For example, as part of my research, an early career teacher wrote a short reflection on the initial weeks of a teacher education course, full of highly-charged emotion and perceptive insights about how her values were challenged and re-focused as she adapted rapidly during this early stage in a new career. When starting her first school placement, this experience may be overlooked by a busy mentor who is keen to provide induction materials, teaching resources and so on. A mentor who understands the prior experiences of an early career teacher, taking the time to explore the starting point for their relationship in depth, is more likely to make a difference to their professional development.

The voices of two early career teachers, one negative and one positive, may serve as a summary, underlining the power of the mentor to “make or break” an early career teacher. The first new teacher found it challenging to manage the (perhaps perceived) relentless demands of the mentor, commenting “expectations are so high” not only from the mentor but also self-imposed, adding

to the overwhelming sense of anxiety at work. Writing a short story as part of her reflection on the initial teacher education program, the reader gains a real understanding of the challenges faced by this early career teacher—“*long wavy grass*,” “*fast deep river*,” “*deep dark forest*” and, perhaps most poignantly, “*a mentor-filled snow storm*.” Teaching may have been the right profession for this individual with her strong subject knowledge and commitment to making a difference to the lives of children and young people, but it was ultimately the detrimental cost of a performativity culture to the individual’s wellbeing which led to leaving the profession. In contrast, there are many stories told by early career teachers of how an inspirational mentor has rescued them in times of need and doubt, challenged them to strive to be even better as a teacher, and empowered them to take ownership of their own professional development. Most early career teachers will experience moments of self-doubt and anxiety about their chosen profession and the mentor has a positive role to play in boosting resilience at such times, as noted in this haiku written by an early career teacher:

*Tired, tears and doubt.
You can do it, mentor said.
Self-belief, vital.*

Concluding reflections

Nurturing the resilience of early career teachers is both a moral and strategic imperative with clear potential to enhance professional satisfaction and retention. Although there is some dissonance between policy makers and experts on teacher education around the world (Ovenden-Hope and Passy, 2021), a key focus on the resilience of early career teachers who are valued and supported remains important in all contexts.

The growing global concern for early career teachers (Paniagua and Sánchez-Martí, 2018) offers some hope that the issue of retention of the newest members of the profession is being accorded its deserved significance. International studies are informative (Hong, 2012; Johnson et al., 2015; Smith and Ulvik, 2017) in exploring ways of supporting early career teachers in a wide range of contexts. A clear sense of purpose among new teachers needs to be extended to policy directives, underpinned by appropriate time and resource for mentoring of early career teachers. For example, Johnson et al. (2014) proposed a framework of conditions which support early career teacher resilience in Australia. Such research has informed current policy in Australia which requires employing schools “to strengthen their role in providing access for early career teachers to high quality induction and mentoring” (Education Council, 2018: iii).

In England, the Early Career Framework (DfE, 2019b: 4) affirms that teachers “deserve high quality support throughout their careers, particularly in those first years of teaching when the learning curve is the steepest.” Such an approach acknowledges the need for ongoing input and support through the early years of the profession on issues around workload and challenges, such as managing behavior and workload. That said, tensions abound at every turn. For example, the ITT Core Content Framework in England has laudable intent, requiring early careers teachers to learn how to “protect time for rest and recovery” (DfE, 2019a), presumably from a standpoint that an overly-stressed teacher is unlikely to be resilient and thrive in the profession. And yet, as one early career teacher commented about the importance of developing resilience, “... it’s a bit of a case of managing the symptom rather than dealing with the cause of the problem.”

Above all, with a plethora of frameworks intended to support early career teachers, vigilance is needed to ensure that any interest in resilience does not become a manipulative tool (Cooper et al., 2013) for merely ensuring that early career teachers are better equipped to cope with ever-increasing challenges in their work. There is a danger that we delimit education and, specifically, the development of early careers teachers, if we assume that resilience “is more a code for social compliance than a political ambition” (Evans and Reid, 2014: 102) as we seek to transform the professional journey of early career teachers in a positive way.

Systemic change is needed, but there are also more immediate and localized actions that may foster resilience of early career teachers. As discussed, these actions include exploration of varied and creative approaches to reflective practice, a personalized stance toward the emotional and affective aspects of early career teaching, an integrated and sustained approach between initial teacher education providers and employing schools, bespoke mentoring support, as well as a carefully sequenced transition for early career teachers in the first few years of teaching. The overall aim must be to avoid the “recruit—burnout—replace” model (Allen and Sims, 2008: 20) with one that focuses more firmly on continuous development, mentoring and nurture for early career teachers (Gordon, 2020b). Early career teachers deserve professional consideration and personalized mentoring, combined with empathy and appropriate challenge, so as to develop resilience and thrive in the profession.

To this end, there are two main reasons why resilience should be a priority in relation to early career teachers. First, there is evidence that resilience building has the potential to “enhance productivity” and “foster workplace well-being and engagement” (Robertson et al., 2015: 559). As a result, early career teachers should remain a prime concern for all those involved in their development. Secondly, as noted by Bajorek et al. (2014), teacher wellbeing, including resilience, has a positive impact on teacher effectiveness and student outcomes. Quite simply, a resilient teacher is more likely to thrive in the profession and make a difference to the lives of children and young people.

I conclude this chapter, not with the words of an early career teacher, but with the words of a fictional character in Foden's (2010: 315) novel, entitled *Turbulence*. The words capture the challenge for humankind in an ever-changing world, including the world of education for early career teachers, to maintain and develop resilience. It is often the incompleteness of the melody, or perhaps losing sight of the beauty of the music, that hinders resilience most.

How in a world of disintegration and endless renewal—a continuum, a world of flow—one must find one's own rhythm exactly by recognizing the incompleteness of the melody.

Introduction

Learning to be a teacher is a complex and multi-faceted process associated not only with the acquisition of professional knowledge and skills; it is also a process of building a realistic professional teacher identity (Arvaja, 2016; Beijaard et al., 2004). Many other, particularly personal and situational or contextual aspects that, together and in interaction with each other, make that teachers are who they are, can be or wish to become. Developing a professional identity is a key element of the transition into the teaching profession, yet teacher education program seem to focus predominantly on acquiring knowledge and skills imposed by the professional community, while neglecting or undervaluing the process of professional identity formation (Cobb, 2020; Rodgers and Scott, 2008).

This chapter highlights the professional identity of beginning teachers and how to support them in their work on their professional identity. In the literature, beginning teachers are named differently, for example: early career teachers, new teachers, or newly qualified teachers. Generally, most resources (implicit or explicit) see this group as a group of teachers, who, after graduation from teacher education, are in their first 3 to 5 years of working as teacher with full responsibility of their classes (Helms-Lorenz et al., 2016). Beginning teachers are often perceived as one group entering the profession with similar challenges and concerns, yet the group is composed of different individuals with different personal and educational backgrounds, needs and interests and sometimes different ages as well, but certainly with different reasons to become a teacher. Actually, beginning teachers together are a very heterogenous group, a feature reinforced by the different schools they enter after their graduation from teacher education.

This chapter starts with an explanation of how the authors of this chapter understand professional identity and its role in becoming a teacher. Next attention is paid to experiences that fuel the identity of beginning teachers while growing into the profession. Beginning teachers may face identity issues that stem from negative experiences between what is contextually possible and personally found relevant or inversely. Research has mapped out a number of these issues. While being important, up till now far too little attention has been paid to the positive experiences of beginning teachers regarding the ways in which person and context align. As far as possible, beginning teachers' positive experiences that influence their professional identity development as well are also discussed. This chapter continues with the aim and characteristics of identity work together with examples of how to support identity development and ends with some implications for identity work and related research.

Conceptualizing beginning teachers' professional identity

Beginning teachers, on average, show a steep learning curve during their 1st years of working as teachers, also because during this period relatively many of them drop out (Helms-Lorenz et al., 2016). It is particularly their 1st years in which they work on the teacher they want to be, in their work with students, colleagues and significant other people such as their school managers and/or leaders and parents (e.g., Cobb, 2020; van der Wal et al., 2019).

Making a professional identity by beginning teachers includes more than focusing on subject matter, pedagogical content knowledge, theories of teaching and learning, and skills to turn that all into practical action. Beginning teachers' professional identity development results from the complex interaction between their personal beliefs, ideals, backgrounds, norms and values they hold, including their experiences as student teachers, and requirements from the context of their schools and the practical situations they face, including widely accepted standards for the teaching profession in general (Beijaard et al., 2004; Garner and Kaplan, 2019). Professional identity understood in this way leads to a number of characteristics that can be attached to it.

Firstly, beginning teachers' professional identity is both a product and a process. As a product, professional identity might be seen as a complex configuration of personal and professional aspects that together make who a teacher is in a given situation on a given moment in time; as a process, beginning teachers' professional identity is constantly subject to change based on the interpretation and reinterpretation of experiences (Olsen, 2010; Schellings et al., 2021).

Secondly and in line with the above, beginning teachers' professional identity and its development are to a large extent situated or contextualized, both as a teacher in the classroom and as a member of the school team. Through reflection on their experiences and setting goals for new experiences based on their own motives, needs or interests, beginning teachers also have an influence on who they want to be as a teacher. Exercising a degree of control over their own work as a teacher and through that staying true to themselves, in the literature often referred to as being agentic (e.g., Etelepälto et al., 2015), is essential to developing a realistic professional identity that fits the individual. In professional identity making, agency ("what comes from within") and context ("what comes from outside") are dialectically related. Some schools offer (beginning) teachers more room for being an agent of their own work as teacher than other schools.

Thirdly, teachers' professional identity is not static but dynamic, depending on the situation in which they find themselves. Different types of students that are taught, collaboration with colleagues, conversations with parents about students, etc. make that teachers' professional identity is multi-faceted. It might therefore be argued that teachers' professional identity consists of sub-identities that are more or less in harmony with each other (Beijaard et al., 2004). Different situations in which teachers find themselves appeal to different aspects of their professional identity. In this context, the literature also refers to various I-positions that teachers take in different situations of their work (Akkerman and Meijer, 2011). Developing a harmonious professional identity can be quite a challenge for beginning teachers during the early years of their career.

Fourthly, due to the many personal and contextual aspects that configure a beginning teacher's professional identity and the way it develops, professional identity is not only complex in nature but (partly) unique as well. As indicated in the introduction, beginning teachers differ from each other in many respects, including differences in backgrounds and opinions about their work as teachers, for example as a result of their own experiences as a student and their upbringing, i.e., their learning histories and biographies in general (cf. Kissling, 2014).

Fifthly, beginning teachers' professional identity manifests itself in their image of themselves as teachers, i.e., how they see themselves as teacher or the teacher they want to be (Akkerman and Meijer, 2011; Beijaard et al., 2004). Beginning teachers' perceptions of experiences in practice that do not match their professional identity may lead to internal or mental conflicts that, in turn, may negatively influence their professional self-image. This can lead to all kinds of reactions, such as denying the relevance of an experience and putting it aside or seeing it as a challenge to work on. Conversely, perceptions of experiences that match well with their professional identity usually confirm or strengthen their professional self-image without any difficulties or concerns. Essentially, beginning teachers' professional identity functions as filter for professional learning and development. Experiences that impact one's professional identity may lead to (dis)continuities in learning and development (e.g., Leeferink et al., 2019; van Rijswijk et al., 2018).

Sixthly and finally, beginning teachers' professional identity development is not merely a cognitive process; it is also an emotional process (cf. Zwart et al., 2015). It goes without saying that certain experiences that lead to significant discontinuities in beginning teachers' professional identity can be accompanied by heavy emotions such as frustration, dissatisfaction, uncertainty, anger or even disgust (Hargreaves, 2001; Zembylas, 2003). Particularly in situations in which beginning teachers experience strong negative frictions between the personal and contextual. In the next section, these experiences are discussed in terms of identity issues that many beginning teachers face. On the other hand, when there is a harmonious connection between personal and contextual aspects, teachers' ideals and beliefs act as a driving force for engaging in the environment, an environment in which the teachers flourish and grow as professionals (Zwart et al., 2015). Unfortunately, without receiving the appropriate support, positive experiences that create feelings of flow may eventually result in negative emotions as well (Hoekstra and Korthagen, 2011).

Constraining and cultivating professional identity experiences

Beginning teachers' professional identity making is seen in this chapter as a complex, to a large extent unique and continuous process of reconciling the personal and contextual. Teachers' contexts either provide them with opportunities to cultivate or to constrain their professional identity development in terms of the teacher they want to be. As written above, feelings of constraints are often accompanied by negative emotions. On the other hand, emotions like joy and satisfaction occur when things are going well, such as experiencing good relationships with students and colleagues, which fuel feelings of being a successful teacher (Vähäsantanen et al., 2020). Below attention will be paid to experiences that both constrain and cultivate or strengthen professional identity development; the first ones in terms of identity issues, the second ones in terms of experiences that confirm or reinforce identity.

Identity issues beginning teachers face

Research on beginning teachers' professional identity has revealed insight into what issues beginning teachers face when reconciling the personal and contextual in becoming the teacher they want to be. These insights particularly pertain to:

1. The transition phase from a student who is still in teacher education to a beginning teacher in school with all associated responsibilities, which can be experienced as overwhelming and, through that, lead to experiencing an imbalance between private life and work and regularly characterized by emotional exhaustion and symptoms of burn-out (e.g., Pillen et al., 2013; Schaefer and Clandinin, 2019).
2. The ways beginning teachers position themselves in their work toward relevant others. Teachers' position taking depends on the situation they find themselves in and the people in that situation (i.e., students, colleagues, school leaders and others, including parents in particular). Ideally the positions they take coincide with "who they are" and that they are also recognized as such by others. In their work with students, they want to be recognized as a competent teacher. Students are particularly for beginning teachers very "critical reality definers" (Beijaard, 1995); their relationship with students touches upon the core values of their work, including accompanying feelings, and may therefore enhance a deeper awareness and image of themselves as teachers (Mommers et al., 2021). By colleagues and school leaders they want to be heard, accepted, and have the opportunity to share their concerns and ideals with them. It is important that teachers are able and given space to make their own voice heard and to position themselves in ways they want to (Akkerman and Meijer, 2011). Conflicts between how beginning teachers want to position themselves or what is possible in reality, may threaten the development of their confidence, self-esteem and well-being often accompanied by negative emotions (e.g., Hargreaves, 2001).
3. The confrontation with the micropolitical reality in schools may hinder or promote beginning teachers' socialization in schools. Among other things, this is reflected in the atmosphere in the school, in how teachers collaborate, how new teachers are seen and introduced in a school, and in leadership in the school. For beginning teachers, working conditions like these are essential for an optimal growth as professionals in schools. Negative experiences with these conditions are often accompanied by negative feelings as well and by feelings of vulnerability (e.g., Kelchtermans and Ballet, 2002). Working conditions also influence the ways in which beginning teachers can and may position themselves in the school as described above.
4. The commonly shared beliefs, views, and values about teaching and education; they are collective stories shaped by traditions of schools and the place of schooling in society, i.e., the professional landscape that metaphorically can be understood as a "storied landscape" in which teachers live and work (Connelly and Clandinin, 1997, 1999). "Stories to live by" can provide beginning teachers with useful guidelines for growing into their work as teachers, but they can also be experienced by them as persuasive, demanding and restrictive for the teachers they are or want to be (see also Schaefer and Clandinin, 2019).

The above-mentioned types of issues are described in more detail and illustrated with examples elsewhere (Beijaard et al., 2022). How and the extent to which they occur in beginning teachers often remains hidden, despite their sometimes significant impact on the teacher one is and wants to become. It turns out that dealing with such issues is often quite an internal struggle for a large number of them and should therefore not be left to themselves. Making experiences regarding identity issues explicit and sharing them, for example with peers and a mentor in school, can help beginning teachers to develop a professional identity that fits the person and their context, including alignment with relevant professional knowledge and skills that are important for the teaching profession as will be discussed later in this chapter.

Experiences that confirm or reinforce beginning teachers' identity

Experiences that have a positive influence on the professional identity of beginning teachers are to a certain extent the flip side of the identity issues described above. To date, however, research on beginning teachers' processes of reconciling the personal and contextual has mainly focused on identity issues. In other words, experiences that foster continuity in professional identity development, while identity issues predominantly cause discontinuity. Hardly no research is available that reports on experiences that show how the personal and contextual influence each other in a positive way, thereby confirming or reinforcing beginning teachers' professional identity and thus fostering its further development. For this reason the authors draw back on one of their own studies (Mommers et al., 2021).

This study started from research literature on contextual or situational influences on the professional identity of beginning teachers and expressed in their professional self-image. Much of this research has already been referred to in the overview of professional identity issues in the preceding section. Against this background, research was conducted into: (1) the influence of significant others, focusing on beginning teachers' contact with students and their positioning toward students, colleagues and school leaders, and (2) stories beginning teachers "live by." One cohort of 46 beginning teachers from 11 secondary schools voluntarily participated in the study. As part of a 3-year lasting induction program in the Netherlands these teachers attended a number of so-called "identity workshops." Before these workshops the teachers carried out three writing assignments; for each assignment they were requested to write a narrative of approximately 400–600 words.

Moments of contact with students

Moments of contact, either individually or in groups, with students are essential for the development of teachers' professional identity. All beginning teachers not only experienced one or more tensions in their moments of contact with students, most of them

caused by discipline problems, they also and especially reported on successful experiences in their moments of contact and wrote about these moments as being conducive for their satisfaction, self-confidence, and well-being in general. These positive feelings particularly arose when their contact with students was mutually found important and characterized by exchange of personal information. Teachers also reported on feelings of success in case of improvement of difficult relationships with students and growth of bonds, for instance, when students start co-operating in class or share personal information. They felt they could really make a difference.

Positioning toward students, colleagues and school leaders

The positions teachers take in their work ideally coincide with “who they are,” regardless of the situations they find themselves in. Most beginning teachers’ positions toward students were congruent with their desired positions such as enacting a coaching role, fostering students’ own responsibility for their learning, and being the “driving force” behind students’ learning routes. Only a few of them felt discomfort in their positioning toward students, particularly due to problems with classroom management and working conditions like having full classes and demands to teach in a certain way. Almost all beginning teachers positioned themselves also positively toward colleagues and reported on a good cooperate with them, for example, by developing new curricula together. Having a good and productive relationship with colleagues appeared to evoke feelings of success and the ability to perform on a higher level than working alone. A few teachers, however, explicitly positioned themselves as alone and indicated having a low status in the group. Some of them did not feel free to express their own opinion either. A large number of beginning teachers also positioned themselves positively toward their school leaders, and explained that they collaborated with them or that their school leaders took their innovative ideas very seriously. These beginning teachers mostly felt to be part of the “driving force” in the school and being able to express the teacher they are. Only a small group of teachers explained their positioning toward school leaders not so much as negative but more as compliant or cautious, for example, due to uncertainty about continuation of their job.

Stories to live by

Teachers draw on stories to live by; they use them as frames of reference for their interpretation of personal and social experiences and, through that, make sense of themselves as teachers. The beginning teachers reported both “in-classroom” and “out-of-classroom” stories to live by. In-classroom stories pertained to being part of current education “in transition” with a focus on the implementation pedagogies that activate student learning and give students more individual support. All beginning teachers experienced these stories to live by as positive challenges to their work in the classroom. Nevertheless a large number of them also reported on the pressure of high standards they had to meet, based on feelings of high expectations regarding their work held by others as well as by themselves. Out-of-classroom stories pertained to teachers being at the center of change in today’s education (more focus on students’ interdisciplinary competencies and personalized education). This change appeared to match many beginning teachers’ desires to innovate, meanwhile being realistic about the practical problems and struggles that must be overcome for this. Another out-of-classroom story pertained to the need and relevance of cooperating with colleagues, thus being a member of a school team. As written before, through collaboration with colleagues many beginning teachers experienced feelings of success and were able to perform on a higher level than working alone. The other side of this story, though much less reported on, regarded teachers who used to work individually without mutual consultation or contact, often accompanied by feelings of disappointment.

The results of the study reported on are far from representative. They indicate that beginning teachers do experience identity issues when reconciling the personal and contextual, but that this is not so bad and seems to be less than much research literature suggests, both in general and more individually. The beginning teachers who took part in the above-mentioned study did not report serious identity issues, with few exceptions. On the contrary, many of them experienced positive challenges showing much continuity in their professional identity and its development. It therefore seems important in supporting beginning teachers to pay attention not only to identity issues but also to challenges that foster their professional identity development.

Supporting beginning teacher’s professional identity development

Identity development is an internal and above all personal process that might remain hidden. Making challenges or issues that are typical for one’s professional identity and its development explicit and sharing them with peers or a mentor is not common practice and may even be experienced as awkward by beginning teachers. As process, working on one’s identity takes time and usually does not result in quick answers or solutions to one’s immediate issues or challenges, such as how to engage *all* students in learning when introducing a new topic. Identity work or being actively engaged in professional identity formation, requires deep reflection upon oneself in different situations. Some beginning teachers work on their professional identity on their own while others need to be encouraged to do so. Nevertheless, it is argued that they all need support with their identity work. The above mentioned characteristics that stem from our perspective on professional identity help to define the aim and settings of “formally” organized program that support identity work.

Aim of identity work

Teachers’ identity work requires from teachers to process their understanding of themselves as professionals and, as such, building realistic “images-of-themselves-as-teacher,” i.e., the teachers they are and want to be. The core of this process is unraveling the

experiences stemming from the interplay between the personal and contextual in being and becoming a teacher. Understanding oneself as a teacher means acknowledging that one's functioning and wellbeing strongly depend on the teacher as person and his/her personal interpretations of experiences (Schaefer and Clandinin, 2019; Schellings et al., 2021).

Formally organized identity work may particularly support beginning teachers in their negotiating part of constructing a professional identity (Beijaard and Meijer, 2017; Vähäsantanen et al., 2020). Such identity work supports beginning teachers to stay true to themselves and being valued as such. By far identity work does not mean that beginning teachers learn to copy or imitate their colleagues' thoughts, beliefs, and teaching practices. Identity work means that beginning teachers are searching and finding their personal way of teaching, respect and value collegial differences, reinforce each other's strengths, or (possibly) even search for other contexts that fit their professional identity better.

Particularly within the transition phase from student to full responsible teacher, identity work is important. However, professional identity work is an important ongoing process in further career stages as well with a focus on sustaining and maintaining a positive professional identity (Schaefer and Clandinin, 2019; van der Want et al., 2018). Professional identity continues to develop because of changes in personal life or because of new experiences, either self-initiated on the basis of personal experiences and changes in knowledge and beliefs or under the influence of the context such as having to teach students with other ages or level than usual (cf. Lee, 2013). When beginning teachers (experience to) value the merits of identity work in the beginning of their career, they might be more willing to engage in identity work during their midcareer or late career.

Characteristics of identity work

To reach the above aims of identity work, beginning teachers need to engage in deep reflection on who they are, want to be, and/or can be. Formally organized program supporting identity work, must find ways to foster this kind of reflection, be tailor-made focusing on strengths, reveal growth, and take place in a safe environment.

The role of reflection

A realistic professional self-image results from an internal process of framing and reframing experiences often fueled by reflective discussions with others (cf. Korthagen and Vasalos, 2005). In our studies (Mommers et al., 2021; Schellings et al., 2021), peer discussions helped beginning teachers to reflect on differences between aspects they personally find important for their work and how these aspects are shaped or filled in by the context of their school. Reflection tools (for example, writing in a diary about experiences and how these are influenced by personal and contextual aspects or filling out specific questionnaires regarding identity issues) certainly helped them to think about their professional identity, but the (peer) discussions about the completed tools within these studies "forced" the beginning teachers to explain or elaborate on their (written) thoughts to their peers guided by the mentor who moderated the discussion.

Tailor-made support aimed at strength

Identity development is a personal and unique process. Its support needs to be tailor-made, even when plenary "identity meetings" are organized for a group of beginning teachers. Identity work requires the focus on beginning teachers' individual strengths and qualities, needs to emphasize positive challenges that the person has experienced and to embrace the innovative potential the teacher may have and bring to the school (Kelchtermans, 2019; Zeichner and Gore, 1990; Zwart et al., 2015). While the role of positive experiences in identity work has to become more prevalent, the issues that beginning teachers face can of course not be ignored. Beginning teachers learn from their issues with the appropriate support (Pillen et al., 2013). Through identity work beginning teachers learn to conceive their issues as intriguing challenges or as learning goals that stimulate them to grow as professional, especially when the issues are shared and discussed with their peers.

Recognizing growth

Beginning teachers need to be encouraged to reflect upon their professional growth enhanced by experiences in different situations over time: what was improved in this particular situation compared to the previous one? Recognizing growth can be hampered when growth consists of small continuous steps or when growth takes a nonlinear route (Garner and Kaplan, 2019; Leeferink et al., 2019). To grow as professional, beginning teachers themselves need to see and appreciate the value of what they know and do as being in line with their professional self-image, because it is particularly this image that fuels their professional learning and development (Pinnegar, 2005). It is important that they feel responsible for their own identity making and therefore take the lead in their growth as teacher by making own choices in their professional development (Beijaard and Meijer, 2017; Vähäsantanen et al., 2020).

Safe environment

Dealing with emotions, either pleasant or unpleasant ones, is inherent in identity work and have a bearing on one's expression of identity in front of others and the shaping of it (Beauchamp and Thomas, 2009; Nichols et al., 2017). Identity work must provide a safe surrounding in which participants can freely and openly discuss their issues or challenges and related experiences. Establishing a safe surrounding is one of the tasks of a mentor, who will have to take an unbiased and independent perspective in helping beginning teachers to interpret the specific school context and its unique interplay with the particular teacher. Beginning teachers need to experience unconditional support of their mentor and not feeling judged on possible deficits.

Program aimed at identity work

Different programs for identity work are published, all aiming at becoming aware of and reconciling the influence of personal and contextual aspects on the teacher one is, wants to be or can be through deep reflection on experiences. For example, [Stenberg \(2010\)](#) organized about 20 meetings for beginning teachers discussing their autobiographical stories (reflections on life-experiences) and video diaries (reflections on classroom practices) in order to unravel their core values and decisions made within their school contexts. The results showed that “transformative” reflection, a phase in which inner beliefs, values and understandings are critically considered by the person was hard to reach (two of four teachers did). The teachers mainly explained the video diaries by means of their existing thoughts and practices; they did not consider to change their perspective in making sense of their experiences.

In the identity work of [Leijen and Kullasepp \(2013\)](#) organized in the form of peer dialogs, 11 beginning teachers focused on finding solutions for experienced tensions (for example, feeling a gap between the theoretical teacher education program and teaching practices in school). The results showed that teachers' solutions were twofold, some teachers found an acceptable equilibrium between their tensions, other teachers adopted a new personal pedagogy in teaching. For example, one teacher experienced a tension between her personal conviction and the ideas of the teacher education program about the value of collaborative assignments. She originally considered collaborative assignments as time consuming and resulting in limited student learning. During the identity work, she came up with some additional conditions in her conviction to reduce her tension. She now believed that collaborative work is useful in some classes where students are more capable in working together and only when there is sufficient time. A few other teachers adopted a new personal pedagogy in teaching to solve their tensions. For example, a teacher, whose tension was about classroom management, established some personal rules to maintain discipline in her class. She realized that her personal rules differed from her colleagues' rules and, probably because of these differences in rules, she had to repeat her rules in her class again and again.

In another program ([Vähäsantanen et al., 2017](#)), four different professional groups (academic teachers, administrative personnel, nurses and physicians) portrayed their professionalism in an arts-based assignment, named “the Professional Body.” The participants received a drawing of a human body on paper, which they personalized by bringing to it different symbols (e.g., in writing, painting, pictures, clippings, and drawings) that were related to their professional identity. These self-chosen symbols connected to different identity questions, such as who I am, what is my history, what do I know, what are my dreams, etc. Next to “the Professional Body,” an experienced coach offered other less-explained assignments (such as drawing autobiographical timelines) that stimulated the participants sharing experiences and collectively searching for how they could understand their own professional identity. In interviews following the program, the participants told they had learned about themselves as professional, about their professional relationships, about personal competencies, and about themselves as a person.

To illustrate more in depth how to engage in identity work, we present two of our own studies into formally organized identity work for beginning teachers in which different assignments were used to start peer discussions about the participants' professional identity. Both studies were part of a more comprehensive induction program for beginning teachers. The first study consisted of a 1-year lasting series of school transcending identity workshops ([Schellings et al., 2021](#)) in which beginning teachers were stimulated to thoroughly reflect upon both personal and contextual aspects influencing their professional identity. During each workshop, the teachers were asked to (individually) reflect on these aspects with help of diverse assignments. In one workshop, the assignment concerned filling out a frequently used and validated Identity Tension Questionnaire developed by [Pillen et al. \(2013\)](#). A second assignment, in another workshop, concerned detecting personal key values in a challenging situation (for example, the situation of motivating all students to learn independently). The next assignment in a next workshop, asked from the beginning teachers to reduce their tensions by searching for a feasible balance between conflicting perceptions on three elements: the teacher's role, the role of all persons, and the perceived task in a challenging situation ([Schellings et al., 2021](#)). In the last workshop, the teachers were asked to draw and explain their storyline in which they visualized their growth as beginning teacher in the past year (cf. [Beijaard et al., 1999](#)). All assignments, although different in form, had in common that they triggered the teachers to explicate their perception of what aspects are important for the teachers they are and/or wish to be. Reflection outcomes were thoroughly discussed during the workshops, alternately in small peer groups and plenary. After discussing, the teachers wrote down their newly acquired insights about their professional identity in their personal notebook (for example, after a discussion in the workshop a teacher wrote: *“I have trouble in balancing work and private life. I sacrifice too much spare time to prepare my lessons according to my standard”*). At the end of each workshop, they were asked to formulate a personal learning goal to explicate what to focus on in the in-between periods of the identity workshops (for example, the teacher quoted above wrote: *“Good is good enough, I have to learn to lower my standards”*).

In our second study regarding aspects that influence beginning teachers' professional identity ([Mommers et al., 2021](#)), three digital assignments were administered and afterward discussed in a peer group. Several empirical outcomes are already presented in [Experiences that confirm or reinforce beginning teachers' identity](#) section to demonstrate the impact of focusing on beginning teachers' positive experiences. Each assignment started with a short description to relate the particular task to professional identity: the influence of significant others (in moments of contact and in positioning toward others), and the impact of the teachers' professional landscape (stories to live by). In the assignment “contact with significant others,” teachers described a moment of contact with their students triggered by open ended questions: *“What do you intend with this moment of contact?”*; *“What is the situation at hand?”*; *“What do you find important within this moment?”*; *“How do you feel when the moment turned out to be different as you expected?”* The teachers were also deliberately asked to describe their feelings of success: *“How do you feel when this moment of contacts proceeds well?”*.

In the assignment “positioning toward significant others,” beginning teachers choose three images to symbolize their positioning toward students, colleagues, and school leaders. Then, they explained why they had chosen the particular image and reflected on the relationship between the three chosen images. For example, for positioning toward students: a red fish swimming in a school of green fishes that symbolized the feeling of being equal to students while being their leader at the same time. For colleagues, for example: a circle of colored persons who stand hand in hand to demonstrate both collaboration and the important role of individuals’ contribution. For school leaders, for example: an image of chess play to illustrate the political climate within the school organization. In our study, the beginning teachers took strong and equal positions toward each group and their positioning appeared to align with whom they are and want to be both as a person and professional.

In the introduction of the third assignment, “stories to live by,” it was explained that the professional landscape of the teacher can be metaphorically understood as a “storied landscape” (see [Experiences that confirm or reinforce beginning teachers’ identity](#) section). By presenting two stories, one about “teaching in class” and one about “out-of-classroom” work, the teachers described stories of their landscapes that they experienced as important for their work as teacher. In composing the stories, the beginning teachers were asked to use a metaphor. The metaphors mentioned by the teachers were, for example, oceans with raging waves, high mountains with cliffs, and blooming gardens. After each assignment, the teachers explained their written thoughts and, with help of a mentor, explained to each other what the completed assignment meant to them professionally. For example, one fragment from a story about teaching in class: *“Education is like a funfair. It is up to me to guide the students past popular attractions, I have to let them experience several rides, train them and let them attain skills to throw the rings or drive bumper cars. I hope to teach them which attractions are helpful and which distractions they better avoid”*. By creating a personal bond with her students, this beginning teacher helped students to stay focused and active in their learning. The impact of this story on the teacher was positive, because she strongly cared for the wellbeing of her students.

Above program require beginning teachers to think in depth (and to discuss) about issues, challenges or experiences that touch upon their professional identity. They all seem to share a focus on supporting how to become aware of their identity and personal and contextual aspects that influence this identity, which is the first aim of identity work. The second aim, the negotiating part, is hardly supported. Therefore, new program should focus more on the goals the beginning teachers set themselves for becoming the teacher they want to be and which experiences they need in order to pursue own motives, needs or interests in becoming that teacher. Identity work helps beginning teachers to work on personal factors, such as lowering one’s personal standards, but identity work also support them to work on “troubling” contextual factors, such as reducing organizational tasks (for example, organizing school excursions or leading a school musical) when time for teaching seems fading out. Being aware of one’s identity helps the person to stand for oneself by being “agentic” or “resilient.” Literature refers to “being agentic” as taking some control of contextual factors and pursuing personal goals, and to “being resilient” as positively dealing with identity issues ([Etelepälto et al., 2015](#); [Johnson et al., 2014](#)). Teachers, who are socially and emotionally responsive in their professional relationships and who have a personal commitment to teaching, are more likely to transform identity issues into positive challenges that take account of the person ([Johnson et al., 2014](#)). Identity work must support all beginning teachers to figure out whether and how they take their role in finding their own solutions in coping with issues.

Implications

There is a gap between theoretical perspectives on the importance of professional identity development and actual mentoring program for beginning teachers. It is therefore essential to find settings in which beginning teachers are supported to reflect on their professional identities, such as induction program specifically meant for them. Program that support professional identity development need initiatives among which tools that can be used for identity work and direct (peer) discussions about teachers’ experiences that constrain, cultivate or strengthen their professional identity development. In other words, these (peer) discussions are about identity issues and positive experiences. To be more specific, identity issues such as being a full responsible teacher but still having strong feelings of being a student in teacher education and balancing private life and work; positive experiences like having established a good bond with students and being seriously heard by colleagues and school leaders.

Narrative data sources are very helpful for these discussions, such as writing autobiographical stories and demonstrating video diaries ([Stenberg, 2010](#)), drawing and explaining storylines ([Meijer et al., 2011](#)), constructing autobiographical timelines ([Vähäsantanen et al., 2017](#)), keeping digital logs and biographical interviews ([Leeferink et al., 2019](#)). Also specific assignments that lead to narrative data can be applied to stimulate these discussions, for example, choosing and explaining symbols or metaphors like the ones described earlier in this chapter ([Mommers et al., 2021](#)) or “the Professional Body” ([Vähäsantanen et al., 2017](#)). Narrative methods have in common that they direct the user (here the beginning teacher) to take an overall view upon personal experiences and to explicate or (re)define those experiences, and, with or without the help of a mentor, make sense of them. Making sense is triggered by the relational, temporal and situational dimensions found within a narrative, particularly in stories ([Clandinin and Connelly, 2004](#)). The relational dimension pertains to personal and contextual factors that are described, the temporal dimension refers to the continuity of experiences in past, present or future, and the situational dimension refers to the situation in which the experience took place. Narrative methods thus offer a rich starting point for understanding and interpreting events as experienced and told by the teacher ([Clandinin and Connelly, 2004](#)).

The mindset about professional identity, allocated time and even some facilities, such as a place at school, are important to engage in identity work but, unfortunately, not often recognized in school’s practices. Teachers, coaches and school leaders need

to acknowledge that working on a professional identity does not provide hands-on answers to urgent matters during a school day. Working on professional identity supports the teacher to grow as a professional with a well-considered and realistic self-image, who is able to act accordingly and who is recognized by students, their parents, and colleagues as such. Teacher educators and/or coaches in schools need a more explicit and well-developed mindset about the relevance of identity work and learn how to provide beginning teachers with support in this field. Formally organized identity work goes beyond guiding professional knowledge and skills, it also and particularly is about coaching the person to become the teacher one wishes to be and can be. One important goal is that mentors succeed beginning teachers in appreciating to engage in identity work. Next, mentors need to learn how to guide (peer) discussions about revealing one's professional identity by analyzing and interpreting experiences and how to deal with teachers accompanying emotions that these processes may trigger. Important is how to organize tailor made identity program; for example, uncertain teachers need to be triggered to become seriously heard within the organization, innovative teachers must be stimulated to set up new collaborations with colleagues to contribute to school development, and perfectionists can be helped to set more realistic aims in their teaching (cf. Schellings et al., 2021).

In program for beginning teachers, some attention for professional identity development is gradually appearing, yet systematic knowledge about designing *and* evaluating formally organized identity work is still lacking. Important research questions are how and to which extent coaches in schools are currently organizing and doing identity work? What is the impact of formal identity program on beginning teachers' functioning and wellbeing, at the start and further during their careers? In this chapter, some examples of identity program are given, but what are the similarities and differences within these and other identity program and which elements of these program are most powerful in constructing a positive, realistic professional identity? What makes that beginning teachers and their coaches become to understand the value of identity work in addition to developing competent teachers? What takes away the "awkward" feelings or "feelings of resistance" to engage in identity work? What knowledge and skills do mentors need to support identity work with beginning teachers? We emphasized the role of positive experiences during identity work, however the impact of supporting individual qualities on professional identity is less examined.

Answers to such questions help to design induction program in which identity work takes a (more) central part. We suggest that an induction program starts with one or more identity workshops about beginning teachers' experiences and interpretations of these experiences regarding ways in which they reconcile the personal and contextual and what issues or challenges this raises. Ideally, beginning teachers have to be enabled to meet peers who work in different school contexts, which makes the impact of their specific configuration of personal and contextual factors on themselves even more clear. Since professional identity is an ongoing process, identity work is not restricted to the induction phase, it is also valuable at other phases during one's career. Formally organized identity work must be inserted in school practices and policies. Yet formally organized identity work is just a (powerful) tool, in the end it is the (beginning) teacher who has to engage in identity work and experience this as a relevant aspect not only of becoming but also of sustaining and remaining a professional teacher.

Introduction

The knowledge, skills, and characteristics of individuals that determine the quality of how they perform tasks, is referred to with the concept of "expertise" by Ericsson and his colleagues (Ericsson, 2018b). Ericsson defines as "experts" in a domain, those who are consistently able to exhibit superior performance for tasks that are representative for that domain. Ericsson et al. use a cognitive psychological perspective when studying expertise and its development. A vast amount of research has been carried out on expertise and its development from this perspective. This research is summarized in a series of handbooks that were published over the years (Chi et al., 1988; Ericsson et al., 2006, 2018; Ericsson, 2009; Ward et al., 2020). Much of this research focuses on what sets apart experts from others who are not that proficient (yet) in different domains such as chess, music, sport, computer programming, and radiology. Although the attention for expertise and expert performance of teachers is limited to one article in one of these handbooks (Stigler and Miller, 2018), this literature is important for a better understanding of the nature of teacher expertise and how it develops. In this contribution, we will highlight some findings of this research and apply it to teacher expertise and its development.

Despite its contributions, research on expertise from a cognitive psychological perspective has also been criticized for several reasons. A first reason is that this research tends to focus on expert performance in tasks which are relatively stable in time and across contexts, with relatively easy to measure and unambiguous outcomes. Examples of such tasks are performance in chess and playing a musical instrument. However, in most domains, like teaching, experts will be frequently confronted with new insights or changes in the context in which they carry out their tasks. Those people who can respond well to these changes are referred to as "adaptive experts" and are distinguished from "routine experts". They have a set of core competencies that they apply throughout their lifetime with greater and greater efficiency (Bransford et al., 2005; Hatano and Inagaki, 1986). In this contribution, we will elaborate on the differences between adaptive and routine experts. We will also discuss the implications for teacher education and teacher professional development.

The nature of expertise from a cognitive-psychological perspective

Just after the second world war, the Dutch chess master and psychologist Adriaan De Groot finished his thesis (De Groot, 1948/1965). In this thesis, he described experiments in which grand masters of chess and proficient amateurs in the game were asked to recall realistic and random board positions. The grand masters turned out to be much better than the amateurs in remembering

the realistic board positions, but differences were small when the chess pieces were randomly placed on the board. From his experiments, De Groot concluded that, contrary to popular beliefs, may be it was not thinking ahead that made of most of the difference between grand master and master chess players and others, but perception and knowledge of board positions.

Gobet and Charness (2018) and many others regard De Groot's experiments as the starting point for modern-age research on expertise from a cognitive-psychological perspective. In more than 70 years of research on expertise from this perspective, much has been learned about the general mechanisms underlying expert performance and what distinguishes experts from others. Also, a large body of literature is available on how expertise develops and what can be done to stimulate this development.

Experts' use of memory resources

When experts are defined as those who perform the tasks in their domain more effectively and efficiently than others, as a consequence the research focus will be on what distinguishes them from others. When taking a cognitive psychological perspective, research will concentrate on the way in which experts structure information in their memory and use, and by doing so circumvent the limitations of human memory (Feltovich et al., 2018). To understand those limitations, it is first important to know more about how memory works.

Human memory consists of different memory systems. Baddeley et al. (2015) distinguish between two main systems: Long-term memory and working memory. Within long-term memory, two subsystems can be distinguished. The first subsystem is the explicit or declarative memory, from which people can retrieve facts or (conscious) memories of events. The second subsystem is the implicit or non-declarative memory that forms the basis for automated skills such as reading, walking or driving. The second memory system is the working memory. People use this part of the memory to perform cognitively complex tasks, such as reasoning, learning and understanding. A first subsystem of the working memory is the visuo-spatial sketchpad, where people temporarily store visual, spatial information. A second subsystem within working memory is short-term memory, in which people temporarily keep small amounts of information required for a cognitive task.

A first and fundamental limitation of human memory is the capacity of short-term memory. Humans can only keep about seven units active in it (Miller, 1956). That means that a series of numbers such as 1 4 9 2 0 1 9 6 9 (nine units) is almost impossible to remember for most of us without specific training. A work-around to overcome this limitation is clustering units into a smaller number of meaningful units, to which Baddeley et al. refer as "chunks". In our example, meaningful chunks could be years: 1492 0 1969. These years are easier to remember if meaning is attached to them: 1492 is the year in which Columbus was the first European (on record) to set foot on American soil; 0 is the beginning of our era; and 1969 is the year the first man set foot on the moon.

Unlike short-time memory, human long-term memory has an almost unlimited capacity in practice, but here the limitation is that it is sometimes difficult to retrieve information quickly. The way in which information is organized in long-term memory can remedy this. Chess grandmasters, for example, perceive positions of chess pieces on the board as one configuration that they recognize in a fraction of a second from the tens of thousands of configurations they have stored in their long-term memory as chunks (Gobet and Charness, 2018). In addition, they have developed the ability to immediately see when a chess piece has an exceptional position that presents an opportunity or threat, which requires action. Experts have highly automated the recognition of such configurations (Feltovich et al., 2018). How this knowledge is structured in memory and how these knowledge structures develop, has been extensively investigated in the domain of medicine (Boshuizen et al., 2020; Schmidt and Rikers, 2007). In this research, it was established that the relationship between case recall and level of expertise is not linear but curvilinear: case recall and the use of biomedical and clinical details in case descriptions increase during the first years of training (up to 6 years), but after that point it decrease with experience. This referred to as the "Intermediate effect" (Schmidt and Boshuizen, 1993). Boshuizen et al. (2020) describe how this decrease in recall of details is accompanied by an increasing use of macro-concepts with experience, for which the term "knowledge encapsulation" is used: "a prolonged process of both abbreviation of reasoning lines and integration of new knowledge parts under the same umbrella term." (p. 3). They suggest that chunking in chess memory but also step-skipping in problem solving are manifestations of knowledge encapsulation under the umbrella of such macro-concepts.

Expert teachers use of memory when dealing with classroom situations

For teachers, just like other professionals, it is essential to avoid working memory overload. This is not easy in the everyday classroom. Doyle (2006, 1986) for instance describes the classroom as a place where twenty to thirty students get together with one teacher. The teacher has the task to help all students achieve learning goals by planning and monitoring classroom activities. Doyle identified a number of features of the classroom that are relevant for how teachers carry out this task. A first feature is that a lot of things happen at the same time in the class. He describes how a teacher, while helping an individual student during seatwork, must monitor the rest of the class, acknowledge other requests for assistance, and keep track of time. Also, during a discussion, a teacher must listen to student answers, watch other students for signs of comprehension or confusion, formulate the next question, and scan the class for possible misbehavior. A second feature is the rapid pace of classroom events. The average teacher has over 500 interactions with individual students in a single day, Doyle reports. Because so many things that demand attention happen at the same time and with high speed, the limited working memory capacity of a teacher is easily exceeded. For that reason, novice teachers often feel overwhelmed. Their more experienced colleagues, however, seem to be able to deal with the demanding classroom situations relatively easy.

Early experimental research, comparing how expert teachers, advanced beginners and novices made sense of hectic classroom situation, was carried out by Sabers et al. (1991). The expert teachers in these experiments were very carefully selected to ascertain that they were indeed experts. The researchers compared the skill of these three groups of teachers in recognizing important information in realistic classroom situations. The classroom situations were videotaped from different angles and were shown simultaneously on three monitors with the sound coming from the middle monitor. In comparison with novices and beginners, expert teachers scanned the three monitors more frequently whereas the novices and beginners focused on the middle monitor. The expert teachers turned out to be better able to monitor, understand, and interpret simultaneous, multiple events within a classroom. However, when comparing the three groups of teachers, the differences in how many specific details they remembered were minor. The analogy with the chess players involved in the research by De Groot, that we described earlier, is striking. Both chess masters and expert teachers have developed more effective and efficient routines in recognizing and interpreting important situations than novices and beginners, but the difference is much smaller for insignificant details.

Similar studies comparing experts and novices were carried out by Van den Bogert, Wolff and colleagues using eye-tracking techniques. In line with the earlier experiments by Sabers et al. (1991), these studies show that expert teachers process visual information faster, and consistently check up on pupils more regularly (Van den Bogert et al., 2014). The expert teachers monitored more areas than novices and focused their attention on areas where relevant information was available. Also, their perception of events appeared to be more knowledge-driven whereas novices' perception appeared more image-driven (Wolff et al., 2016). Both Van Tartwijk et al. (2009) and Wolff et al. (2015) focused on expert teachers' knowledge that guides their classroom management strategies using teachers' verbalization of classroom events visible on video recordings of classroom events. Wolff et al. found that experts focused more on learning in the classroom and the teacher's ability to influence learning, and novices were more concerned with maintaining discipline and behavioral norms when watching a series of clips. Van Tartwijk et al. (2009) asked teachers who were identified as experts in classroom management in multicultural classes to comment on the classroom management strategies they used in their own videotaped lessons. The teachers were aware of the importance of providing clear rules and correcting student behavior whenever necessary, but they also wanted to reduce potential negative influences of corrections on the classroom atmosphere. They aimed at developing positive teacher-student relationships and adjusted their teaching methods anticipating students' responses. The classroom management strategies seemed to be guided by script-like if-then expectations about student responses which are likely to be based on previous experiences (Baldwin, 1992).

The development of expertise

Experience and deliberate practice

Experience

People build a knowledge base in their long-term memory through experience, but that is not enough to reach expert level. For example, after taking driving lessons for a specific period and obtaining their driving license, most people no longer pay much attention to further improving their driving skills. Of course, they build up routine by making the necessary mileage, but their development as a driver will stabilize over time. In a similar vein, teachers may start working after completing teacher education at an acceptable level of proficiency, and even though they are likely to develop routine and become more efficient, they are unlikely to improve their performance after a certain level by experience alone. Day (2008) found that most teachers maintain their effectiveness throughout their professional lives, but do not necessarily become more effective over time. He even found that teachers in later years of their professional lives are at greater risk of becoming less effective. This has also been found in the medical domain, where Choudhry et al. (2005) found that the performance of many medical doctors declines with experience. The next section explores how this stagnation or decline in performance can be countered according to researchers using a cognitive psychological perspective.

Deliberate practice

Experts reach their high level in task performance by extending their active period of expertise development by years or even decades (Ericsson et al., 2006, p. 691). Professional musicians and top athletes do this by engaging in series of highly structured activities with increasing complexity designed by a coach, with the aim of improving performance. In between meetings with the coach, they have to monitor their performance and make adjustments to meet the practice goals. This requires concentration. During sessions with the coach, feedback is provided, and new activities are introduced. By going through such training cycles, they postpone full automatization. The term "deliberate practice" was coined by Ericsson and his colleagues for this cyclical process of improvement (Ericsson et al., 1993; Ericsson, 2018a). As a result, experts in domains such as music and sports do not only develop routines that enable them to perform tasks efficiently, but the level of their effectiveness is much higher than that of others. Ericsson (Ericsson, 2018a) illustrates how the course of improvement may differ between experts and others for everyday activities (see Fig. 1).

Ericsson writes that the goal for most individuals is to reach a satisfactory level that is stable for everyday skills. After a period of practicing an activity, its performance will become virtually automatic (the light gray end of bottom arrows of the graph in Fig. 1). This means that a minimal amount of cognitive effort is invested in performance. Experts, however, postpone automatization and remain in phases of deliberate practice. These cognitive efforts result in the development of increasingly complex mental

Fig. 1 An illustration of the qualitative difference between the course of improvement of expert performance in everyday activities. Adapted from Ericsson (1998).

representations of tasks and high levels of control of their performance. The arrow in the middle depicts the development of the group that “gave up” practicing, which results in premature automatization. Again, we use learning to drive a car as an example of learning to master an everyday skill. Most of us who have taken driving lessons will remember the first lessons as incredibly complicated, because our working memory capacity had to be divided between paying attention to traffic around us (including the traffic behind us, visible in the mirrors), steering, operating the direction indicator light, controlling the gas and brakes pedals, and -for the Europeans among us-handling the manual transmission at the right moment. All of that is accompanied by a driving instructor giving distracting commands. After a while, however, most of these tasks become automatized and require far less working memory capacity. In this autonomous phase, it is even possible to have a relaxed conversation with a passenger. Because the quality of this routinized task performance is not “maintained”, it may even decrease. Professional formula one drivers need to postpone automatization to reach the high levels of expert performance that are necessary to participate at the top level of their sport. This requires years of deliberate practice.

The concept of deliberate practice has sparked a lot of interest in the popular literature for expert performance (cf. Gladwell, 2008), but cannot be applied to most professional tasks. One reason for this was put forward by Macnamara et al. (2014). Based on a systematic review of the empirical literature, they argue that the association between deliberate practice and performance has been primarily researched in domains where the predictability of the task environment is high (i.e., the task environment does not change much while the performer is planning and executing an action). Examples of such domains are music and sports, but this association is much lower in domains such as education and other professions where the predictability of the task environment is much lower. Another reason is that professional musicians and top athletes can practice and will get feedback before they perform the tasks in a concert or competition. However, professionals in other areas, such as teachers, have far fewer opportunities to systematically practice and receive feedback before carrying out their tasks. Fadde and Klein (2010) proposed the term “deliberate performance” as an alternative for deliberate practice when professionals systematically work on improving performance in the workplace. They define deliberate performance as “the effort to increase domain expertise while engaged in routine work activity” (p. 6) and suggest that it includes developing exercises that use every-day job tasks instead of training exercises (without adding excessive time) and do not require expert judgment for feedback. Professionals themselves analyze their performance.

The development of teacher expertise

Stages in the development of teachers as professionals

In the previous section, we gave the example of how difficult it is to learn how to drive a car. It requires lots of working memory capacity to be able to execute all the tasks at the same time. After a while, the execution of tasks becomes automatized, and driving can even be relaxing. This course of improvement which people go through when learning to drive a car, resembles the stage that those of us who are (or have been) teachers in primary or secondary teachers may have experienced in the first stage of teaching when we had to learn to deal with the hectic classroom where so many things happen at the same time, which Doyle (2006) so eloquently described.

There is a long tradition of research which aims to describe the development of teachers' expertise throughout their professional lives. Much of this research was inspired by the work of Fuller and her colleagues (Fuller, 1969; Fuller and Bown, 1975), who identified several stages in the concerns teachers have about their development and functioning throughout their professional lives. As a first stage, they distinguish the period before prospective teachers start teaching. In this stage, they are primarily concerned with their own progress as students and do not yet think from a teacher's perspective, but from a student's perspective. In this stage, they can be very critical of teachers. However, once they have started teaching, the second stage, most of these beginning teachers' concerns are related to their own survival in the hectic classroom. In this second stage, beginning teachers for instance focus on class control and being liked by students and on the quality of the way they teach the class. Subsequently, a mastery stage can be

distinguished. In this phase the concerns of novice teachers focus on being able to perform well as a teacher. Concerns are less emotionally colored than in the survival phase and there is room to think about the best pedagogical approach. In the final stage, teachers' concerns focus more on student learning and development. Authors such as Fessler and Christensen (1992), Day and Gu (2010) and Van der Lans et al. (2017) have built on the work of Fuller and her colleagues.

The development of teacher expertise for specific tasks

All studies using the conceptual framework of stages in the development of teacher expertise, have in common that classroom management, including developing a positive working relationship with students, is teachers' most important concern in the first stages of their professional lives. Being able to manage a classroom at an acceptable level is a necessary condition for being able to carry out other teaching activities such as instructing a class. In other words, it is logical that stages can be distinguished in the development of teacher expertise. However, a pitfall when conceptualizing the development of teachers' expertise in terms of stages, is that it might easily lead to the misconception that once a teacher has mastered a routine that requires most attention in specific stage, there is no need to be concerned about this routine anymore and it is time to move on to the next stage. When a teacher would no longer pay attention to the further development of a routine, the risk is that they will not develop it anymore and their level of expertise won't increase anymore, or they may even become less effective later in their professional life (Day, 2008).

Research on the development of teacher expertise related to specific routines throughout teachers' professional life, is relatively scarce. An exception is research by Mieke Brekelmans and her colleagues, who gathered data on the development of teacher expertise in being able to build a positive interpersonal relationship with students (Brekelmans et al., 2005). Being able to build such a positive working relationship is an important component of classroom management (Wubbels et al., 2006). Brekelmans et al. used cross-sectional data among the students of 2388 student-teachers and 3813 Dutch secondary school teachers with 1–36 years of experience. They also gathered longitudinal data among a limited number of teachers (86 teachers for at least 4 years, 37 teachers for 6 years or more). These data were gathered with the Questionnaire on Teacher Interaction (QTI, for an overview see Wubbels et al., 2006) which were completed by students of these teachers by indicating if statements such as "This teacher is a good leader", "This teacher is uncertain", or "This teacher is friendly" applied to their teacher. Underlying this questionnaire is interpersonal theory (cf. Horowitz and Strack, 2011). At the core of this theory is the premise that two independent dimensions are both necessary and sufficient to describe the interpersonal meaning of behavior and the position of individuals in interpersonal relationships (e.g. Leary, 1957; Sadler et al., 2011). Depending on the context (e.g., psychiatry, family, education) the dimensions are designated differently with agency and communion as meta-level labels (Gurtman, 2009). Agency refers to influence and control, whereas communion refers to friendliness and affiliation. A classroom where the social climate is characterized by low levels of teacher agency combined with low levels of communion between teacher and students, is usually a classroom where the teacher has serious problems with classroom management. Brekelmans et al. (2005) established that, during the first 3 years of teaching, mean students' perceptions of teacher influence significantly increased every successive year. After these 3 years, mean differences between years got smaller but still increased until about 6 years of experience, and then stabilized for most teachers. Their analyses showed however, that there was significant individual variation around the mean. Compared with students' perceptions of agency, the students' perceptions of their teachers' interpersonal styles in terms of communion showed far less variation across the teaching career. On average perceptions of communion slightly increased during the first 10 years of teaching and became slightly lower afterward. Differences were large between teachers, but the variations across years for specific teachers were small. These findings suggest that the development pattern of teacher agency during the professional life of teachers does match the stage models described earlier, with a strong development in the first stages of the career, but also resembles the pattern in the development of expertise in other domains with a strong increase of expertise in the first period of professional practice, a slower increase later, and then a stabilization.

Note that the teachers involved in the Brekelmans-study were not selected as experts. In this respect they differ from the expert-teachers involved in the studies to which we referred earlier (Sabers et al., 1991; Van den Bogert et al., 2014; Van Tartwijk et al., 2009; Wolff et al., 2015; Wolff et al., 2016; Bronkhorst et al., 2014) who turned out to be very skilled in monitoring, understanding, and interpreting multiple events within a classroom.

Deliberate practice and reflection in teacher education and teacher professional development

In the domain of teacher education and teacher professional development, the term "deliberate practice" has not been used much to describe the systematic efforts of (prospective) teachers to improve their teaching. One exception is the work of Bronkhorst and her colleagues (Bronkhorst et al., 2011, 2014) who defined deliberate practice as "deliberated activities intended for self-improvement, but also intended to foster pupil learning and development." (p. 20). Such activities are realistic tasks in the workplace instead of training tasks, and therefore this conceptualization of deliberate practice resembles the concept of deliberate performance that Fadde and Klein propose as an alternative for deliberate practice in the workplace (Fadde and Klein, 2010). Bronkhorst et al. describe four characteristics that define deliberate practice: (1) practice should be designed for self-improvement, (2) practice should be repeated to enable successive refinement, (3) practice should be followed by immediate, informative feedback, and (4) practice requires significant effort and concentration. According to these authors, designing such learning activities can be regarded as enacting a (personal) theory of practice. They refer to this as "anticipatory reflection" which they distinguish from "retrospective reflection".

The concept "reflection" is far more common in the domain of research on teachers and their development. Although the concept of reflection has a rich history and many definitions, a common essence is that reflection processes contribute to a learner's development (Dewey, 1933; Van Manen, 1977; Schön, 1983; Poldner et al., 2014). After describing the relevant literature and identifying the various ways in which the concept of reflection is used, Korthagen et al. (2001) conclude that there seems to be a consensus that teachers' professional behaviors are rooted in mental structures which are not static but can be created or altered through experiences and influenced by reflection. They then define reflection as "the mental process of trying to structure or restructure an experience, a problem, or existing knowledge or insights." (p. 58). The process is of a cyclical nature and based on learning activities that are carried out by the actor or subject (e.g., a teacher) during the reflection process. Examples of learning activities are selecting (e.g., certain information), analyzing, synthesizing, evaluating, concluding, and intending (e.g., setting new goals) (Oosterbaan et al., 2010). The outcome of this process, e.g., new insights, beliefs or plans for action, is an indication for learning. Reflection is always related to an "object", e.g., reflection on one's development, beliefs or performance. The object of reflection can also involve critical thinking about the premises upon which a teacher has based his or her analyses or view. By means of reflection, these objects move or transform in several ways to support development, e.g., certain experiences are restructured resulting in transformed cognitive schemes, new perspectives on personal and professional effectiveness, or (tacit) intentions for acting.

Hatton and Smith (1995) distinguish five levels in the object of reflection that they related to the development of concerns during teachers' professional lives that Fuller distinguishes, which we introduced earlier. The first level which Hatton and Smith distinguish is "technical rationality", where the focus is on one's own technical use of essential skills. For the next levels, they build on the work of Donald Schön (1983, 1987), who distinguished between professionals' "reflection-on-action", which refers to looking back on task performance sometime after it has taken place, and "reflection-in-action" which refers to conscious thinking and modification while carrying out a task. Hatton and Smith refer to reflection-on-action as the second level of reflection and write that this type of reflection focusses on the impact of action. Within the level of reflection-on-action, they distinguish three sublevels. At the lowest sublevel, to which Hatton and Smith refer as the "descriptive" sublevel, the focus is on the best possible practice and one's own performance in the professional role. At the second "dialogical" sublevel, teachers reflect on alternative solutions for professional problems. During reflection at the third and highest sublevel, to which they refer as "critical reflection", teachers reflect on the effects of their actions on others taking while taking social, political and cultural "forces" into account. Hatton and Smith consider reflection-in-action as the highest type of reflection because they consider the application of technical reflection and reflection-on-action as a situation is unfolding as the most advanced form of reflection.

Adaptive expertise

Whereas dialogical and critical reflection seem to pertain to thinking activities that facilitate adaptation or change of professional routines, the concepts deliberate practice and deliberate performance refer to conscious practice with the goal of highly efficient and effective routines for task performance. For beginning teachers, developing efficient and effective routines is their first concern, because in the highly demanding task environment of the classroom, it is a prerequisite for professional survival.

Routines, however, have major disadvantages. A first disadvantage is that routines may become so intuitive and tacit that experts don't even realize that they are part of their repertoire (Bransford et al., 2005). It is difficult for many expert teachers to articulate in detail what the critical clues are which they perceive in class situations why they act in the way they do. This is a problem for two reasons. The first reason is that this makes it much harder for them to teach beginning teachers how to teach if they can't articulate why they do what they do. The second reason is that it makes it much harder to change teaching routines if a teacher is hardly aware of them. Researchers very often need special techniques to get teachers to make their teaching strategies and the underlying knowledge explicit, such as stimulated recall (Yinger, 1986), asking teachers to comment on their own classroom management strategies visible on video (Van Tartwijk et al., 2009) or concept mapping (Vink et al., 2016).

Here, it is important to distinguish types of experts that have been mentioned in the literature: routine and adaptive experts (Bransford et al., 2005; Hatano and Inagaki, 1986; National Research Council, 2000). *Routine experts* have a set of core competencies that they develop throughout their lives with growing efficiency, whereas *adaptive experts* are much more likely to change their core competencies and expand and restructure their expertise. According to Bransford et al. this restructuring may reduce efficiency in the short run, but makes adaptive experts more flexible. They emphasize that these processes of restructuring "often have emotional consequences that accompany realization that cherished beliefs and practices need to be changed" (Bransford et al., 2005, p. 45).

A review by Bohle Carbonell et al. (2014) identified a number of differences between routine and adaptive experts. The first of these differences is that, although adaptive and routine experts have a similar extent of knowledge, the knowledge of adaptive experts seems to be more theoretical. Adaptive experts also seem to have more cognitive flexibility and more problem-solving skills. They rely more on analogical reasoning in which they use their knowledge base. According to Chi (2011), this more abstract knowledge base helps them understand the principles and mechanisms that determine why and how routines work. "With such deeper understanding, adaptive experts obviously can "generalize" their skills to other non-routine problems." (Chi, 2011).

The National Research Council (2000) of the USA discusses adaptive expertise as the golden standard for learning. A framework for promoting the development of adaptive expertise in teacher education and professional development is crucial, according to the council.

Implications for teacher education and teacher professional development

Developing routine and adaptive expertise

Referring to them as experts, implies that both routine and adaptive experts are consistently able to exhibit superior performance for tasks that are representative for that domain compared with others, and that they remain in the cognitive/associative phase longer than others and by doing so avoid premature automatization of routines (Ericsson, 2018a). However, there are important differences between how routine experts and adaptive experts develop expertise.

The way in which routine experts develop their expertise, prepares them for performing tasks in domains that do not change. To develop routine expertise deliberate practice is appropriate. Earlier in this article, we have described the process of developing expertise through deliberate practice. Examples of techniques to which the definition of deliberate practice would apply (a cyclical process of consciously and specifically training to improve performance, often with the help of a coach) are video interaction guidance (e.g. Fukkink and Tavecchio, 2010), in ear-coaching (e.g. Coninx et al., 2013), and providing feedback using augmented reality techniques (e.g. Theelen et al., 2020).

Bransford et al. (2005) emphasize that a good balance between the development and renewal of routines is important for the development of adaptive expertise at all levels. Too much emphasis on innovation at a time when a teacher is not ready, due to the lack of routine, can lead to frustration. Too much emphasis on mere routine can result in the teacher no longer being able to adjust his or her task performance properly if necessary. The zone in which the optimal balance has been found between gaining routine and renewal is referred to as the optimal innovation corridor in the literature on adaptive expertise. In Fig. 2, which is adapted from Bransford et al. this is depicted. In this figure, we added the stairs-like shape in the optimal innovation corridor. By inserting this shape, we aimed to visualize the stages in the development of (prospective) teachers: they first need to master a specific routine at a satisfactory level before they can spend their "limited working memory capacity" on the development of other routines. The challenge is, of course, not to prematurely automatize the first routine when the focus shifts to another. This requires reflection in the way it was defined by Korthagen et al. (2001).

Bransford warns that reflection on routines once they are mastered can have emotional consequences. Instead of simply training to improve routines (prospective) teachers are asked to be critical about the routines and the underlying assumptions that they and their colleagues use in practice. This emphasizes that it is crucial to stay within the optimal innovation corridor depicted in Fig. 2 to avoid frustration beyond a level that is unproductive. For this reason, Korthagen proposes to organize the curriculum for teacher education in such a way, that it can be tailored to student teacher concerns (Korthagen et al., 2001; Brouwer and Korthagen, 2005). Of course, this is also important advice when designing professional development for (beginning) teachers.

Practicing for adaptive expertise

In a recent review of the literature, Kua et al. (2020) provide practical advice for courses, programs and professional development that aim to stimulate the development of adaptive expertise. They provide four design strategies that emerged from their analyses of the literature on such interventions: (1) present abstract materials early in the training, (2) facilitate the integration of conceptual ideas with existing knowledge, (3) guide discovery with hypothesis testing and problem solving, and (4) provide instruction on metacognitive processes such as reflection.

Fig. 2 The dimensions of adaptive expertise and trajectories for development. Adapted from Bransford et al. (2005).

Based on a review of the literature as well, Ward et al. (2018) also provide a list of principles for training adaptive skills: (1) provide flexibility-focused feedback, (2) relate concepts to cases in such a way that they illustrate the structural patterns in situations, (3) present tough cases with limited time available for solving the problem, (4) provide cases that are tailored to current needs and proficiency levels, (5) preserve the complexity of the situation in which learning takes place, and (6) promote reflective practice prior to, during and following task performance.

Both the work of Korthagen et al. and the lists provided by Kua and Ward and their colleagues seem to focus on providing theory early but in connection with the context where tasks need to be carried out. This should be done in such a way that learners recognize the structure of the situation which also makes theory more meaningful. Guided discovery and hypothesis testing, solving problems presented in cases, and reflection on cases, all seem to be strategies to train learners in analyzing situations in an inquiry-based manner. Finally, Bransford, Korthagen and Ward all emphasize that providing opportunities to develop (adaptive) expertise should be challenging for learners, but that unproductive frustration because tasks are too hard should be avoided.

An alternative perspective

The literature and the research finding presented in this article until now, all focused on the development of expertise in individuals. In much of this research, task performance of novices and experts is compared. The implicit assumption on which this literature is based, is that expertise is the realm of the individual who strives for the highest possible level of performance in sport, music or in professions in domains such as health care or education.

This assumption is contested by scholars such as Engeström (2018). Focusing on the cognitive foundation of expertise alone ignores that thinking and knowledge are embedded in social situations, practices, and cultures, he asserts. Referring to the work of scholars such as Lave and Wenger (1991), he suggests that expertise should not be conceived as a quality of an individual but that “the proper unit of analysis of skilled human activity is a community of practice rather than an isolated individual.” (Engeström, 2018). Also, Engeström refers to the work of Bereiter and Scardamalia (1993), when he proposes that expertise should be reconceptualized as a process of progressive problem-solving. This resonates with a plea by Ward et al. (2018), who write that being able to adapt routines should be a condition “sine qua non” for designating someone as an expert. Engeström proposes activity theory as an alternative framework for conceptualizing expertise. In this framework, expertise is conceived to reside in an activity system which a heterogeneous group of subjects form together, which is oriented at an object aiming to generate a certain outcome, and which is embedded in a larger community, with a division of labor and specific rules.

It is beyond the scope of this contribution to explore this perspective further, but we introduce it here to point at the importance of other perspectives on expertise than the highly individualized cognitive psychological perspective which also tends to ignore context (Stigler and Miller, 2018). The common practice now is that teachers tend to perform their primary tasks in a classroom setting where they are alone with over twenty students. Their expertise is related to their task performance in that particular context. However, that context is not self-evident: it may for instance differ between urban, suburban and rural schools or between countries. Also, new developments, for instance in technology, may fundamentally change how education is organized. It is the shared responsibility of teachers and others involved in the action system aimed at providing education for all students, to use new opportunities for improving practice in various contexts.

Introduction

Every parent wants their child to be taught by a “good” teacher. Yet understanding what this means is not straight forward. From the perspective of some parents, teachers who help students achieve academic outcomes which enable them to enter the workplace or undertake advanced study may be defined as “good”. For others, values-based education, development of independent thinking, or an appreciation of culture and society may be equally important in defining “good” teachers. In short, they may want a more rounded education for their children. Governments, on the other hand, may want all students to have the same opportunities for education and achievement, regardless of birth, gender and religion, “stock” the needs of a changing workforce, and also be prepared to participate in and contribute to the kind of society which they define as “good”.

From these perspectives, “good” teachers are those who are committed to their work, knowledgeable about the subject(s) which they teach, pedagogically adept, have a strong sense of positive professional identity, are clear about their educational (moral, civic, academic) purposes, those of the organization, parents, and their governments, (though some or all of these may be conflicting), willing and able to manage these, regardless of personal and professional circumstance, (in the face of changes in demands from governments and expectations of parents), and in classrooms in which students are likely to exhibit the results of a variety of motivations, abilities and behaviors.

Over the years, there has been a growing acknowledgment of the complex factors and contexts which teachers must navigate over a career if they are to learn, develop, and sustain “good” teaching. Researchers have focused variously upon the influence of biography, identity, policy, culture, organization, leadership, and moral purpose on teachers’ beliefs, purposes and practices. Such research has usually been carried out as discrete strands of inquiry, and so findings have been valuable, but limited. The same would apply to the impact of much educational small-scale, “cottage industry” research of these kinds on policy and practice. What is still largely lacking is a more integrated, holistic research-informed view which explores how these influences affect teachers’ work and lives. This article will seek to bring these strands together in order to discuss their effects, and how the extent to which they are managed by teachers and their school leaders influences their willingness and ability to teach to their best and well.

Framing the debate

Any discussion of teachers’ willingness and ability to teach to their best and well (good teachers and teaching) needs to be framed within changes in the larger national and international social and policy contexts, many of which influence government policy, and thus schools, directly or indirectly. For example, in this century, many school systems in the West and beyond have been subject to increasing devolution of decision making by governments with regard to governance systems, curriculum, and classroom pedagogies, alongside the development of increasingly sophisticated measures of external surveillance and accountability.

The leaders of most education systems believe now that they are able to judge accurately the successes attained by students, particularly in core areas of literacy, numeracy and science, through explicit criteria of school and teacher standards and student performance in schools both within and between countries, as a result of the development of international tests by the OECD (PISA, TIMMS and PIRLS). What some researchers term “regimes of numbers” have, it has been asserted, become “a resource through which surveillance can be exercised” and “data [have] become the resource for comparison” (Ozga, 2008: 264, 267), Governments’ responses to results in schools in their own countries, and comparisons of these with those in other countries are passed to schools in the form of new demands, and these are then passed on to teachers for action.

In effect, now and in the foreseeable future the work of teachers and the value they bring to students' learning and performance in examinations has become more transparent, "visible," and so more subject to both external and internal interrogation and judgment (Hall and Noyes, 2009). Governments and the public at large have come to assume that there is a direct cause and effect relationship between the quality of teaching, learning and student outcomes, rather than adopt research-informed findings that students' motivation, engagement, learning progress and achievements are likely to be mediated by both the personal and professional qualities of teachers, external social and peer influences.

Although curriculum and system changes have varied in countries and jurisdictions with different political, cultural and educational histories, practices and aspirations, all may be said to have complicated and enlarged teachers' work. Such complications have been further compounded by changes in attitudes and expectations over time in societies, and the persistence of technological advances which enable more information to be accessed, often more quickly by students than teachers, and thus are challenging traditional teaching and learning pedagogies. Taken together, these changes have added to teachers' intellectual, emotional and practical workloads. Because good teaching demands the investment of teachers' personal as well as "professional" selves, they have resulted in increased pressures upon teachers' in managing workloads, and the levels of energy they are able to bring to these. There is now widespread evidence internationally of increases in levels of stress and an erosion of morale in many teachers. In England, a recent survey found that 98% of teachers who responded reported that they were under increasing pressure, 82% reported that their workload had become unmanageable, and 75% reported that their mental health was adversely affected. Only 12% reported that they had a good work-life balance, and 43% were planning to leave within the next five years (Lightfoot, 2016). In England, also, among a growing number of countries, there is now a crisis of teacher recruitment and retention. Seventy-nine percent of schools reported that they were struggling to recruit to retain teachers (Lightfoot, 2016). A similar situation exists in the USA, one of many other countries which report low teacher morale and problems of recruitment and retention. It has been argued that many teachers who work in such 21st century environments are struggling to seek, "a sense of coherence, worth and belonging" (Lumby and English, 2009: 95). Yet, there is widespread evidence that not all teachers have, "set aside personal beliefs and commitments to live an existence of calculation" (Ball, 2003: 215).

I have written elsewhere of five important consequences for teachers' work and mental health, as a result of both the increased dominance of policy voices and changes in the needs of students:

- (i) Increases in the demands on teachers in terms of workload and bureaucracy associated with classroom practices which focus on close monitoring of "visible", measurable student progress on the mistaken assumption that all learning is "linear";
- (ii) The management of teachers' professional learning and development opportunities, so that they are closely aligned to the "functionalist" needs of the school, often allied closely with student performance expectations
- (iii) Participation in collaborative activities has become less of a choice that individual teachers make and more of a formal requirement to be met;
- (iv) The traditional isolation (and as a consequence the "individual" autonomy) of teachers has diminished;
- (v) There are increased pressures on teachers to enlarge the range of their classroom teaching and learning approaches; Such consequences can be found among reports about teacher morale in many countries

Yet while the flow out of teaching, especially among early career teachers in England, USA and Australia, has become alarming, most teachers in most countries stay. Those teachers experience the same shifts in policy, the same increases in workloads, the same dilemmas experienced by all teachers that have been claimed to have led to "de-professionalization", "technicisation", "demoralisation", "stress" and "attrition".

Teachers who teach to their best and well

An important question for those concerned with the quality of teaching and learning, and who wish to understand factors which influence this in changing times and changing circumstances is, therefore, "What influences their willingness and abilities to teach to their best and well?" It is important to use these two terms, because teaching to one's best does not necessarily mean that teachers will be "performing" well, however "performing" is defined. Teachers may be highly motivated, but their ability to help students meet the required output standards may be stronger or weaker depending upon their personal (mental and physical) health, reserves of energy (capacities for resilience), professional competences (knowledge and skills, relational connectedness with students and colleagues), and sense of positive professional identity (efficacy, agency). The extent to which these increase, sustain, or impede performance in its broadest sense may be mediated by external factors (policy, society) or/and internal factors (school leadership, available resources, and professional support and learning cultures). Research internationally into the values, characteristics and behaviors of teachers who teach to their best and well has found that they are those who first and foremost have an enduring internally driven belief that they can make a positive difference to the learning lives and achievements of students, through adding value to their self-belief, aspirations, learning and achievements; and that they do this through who they are (their beliefs, attitudes, personal and professional values, efficacy, sense of agency), what they know (knowledge, strategies, skills) and how they teach—their attitudes, relationships and behaviors in practice settings.

But what does "teaching to one's best and well" really mean? First, teachers can reasonably be expected to focus on increasing students' academic learning and achievement. In these terms, it is difficult to argue with Hattie's general premise that, "All students deserve at least a year's progress for a year's input, no matter where they start" (Hattie, 2015, p. 3). "Value added" techniques for

measuring the rate of students' progress have been developed in recent years, and are used in an increasing number of countries. These enable judgments of teachers' ability to "add value" to the academic level at which their students entered their classrooms to be made. Using these techniques, students' progress and performance may be measured against their own previous performance and home histories. This is known as "context value added" (CVA). Although CVA measures have been criticized for, "the extent to which they successfully control for time-invariant factors" (Gorard et al., 2013, in Morris et al., 2018: 726), they are widely used within schools in England, for example, as a reliable means of measuring student progress that is, "independent of the selection of pupils, background characteristics and innate ability" (Morris et al., 2018: 726; Chetty et al., 2014). This is regarded as a fairer, more equitable way of assessing their progress, and their teachers' contribution to this, than raw attainment measures. Individual results can also be aggregated at school level and compared with results from schools that serve similar socio-economic communities. In this sense, schools and their teachers can be identified as performing well or under-performing.

Yet measuring significant progress, even in terms of a "value-added" comparison between students' academic standing at the beginning and the end of each year, provides an insufficiently nuanced result. It is likely that there will be variations in the pace of student learning, their motivations, the varied effects of being taught by different teachers, and unavoidable unpredictabilities of health and home life. Reports by the OECD on student relative progress and performance suggest, also, that the variance in standards of achievement in reading is greater within than between schools, e.g., 36% versus 64% across OECD countries (OECD, 2009a,b). This may suggest a variance in the quality of teaching and/or other learning resources.

Policy voices across the world emphasize the need for students improved academic achievements. However, while these are fundamentally important, research suggests that we should avoid the temptation of making judgments about quality that rely solely on statistical measurements which apply only to one part of students' progress and achievement and not others. Fenstermacher and Richardson point to the dangers of assuming a direct causal relationship between teaching and learning:

There is currently a considerable policy focus on quality teaching, much of it rooted in the presumption that the improvement in teaching is a key element in student learning. We believe that this policy focus rests on a naïve conception of the relationship between teaching and learning. This concept treats the relationship as a straightforward causal connection such that if it could be perfected, it could then be sustained under almost any conditions, including poverty, vast linguistic, racial, or cultural differences, and massive differences in the opportunity factors of time, facilities and resources. Our analysis suggests that this presumption of simple causality is more than naïve; it is wrong ... good teaching is but one of four ingredient in the mix. The others are that the learner desires to learn and expends the necessary effort to do so; that the social surround of family, community, and peer culture support all assist in learning; and that there are sufficient facilities, time and resources (opportunities) to accomplish the learning that is sought

Fenstermacher and Richardson (2005: 3).

In addition to the issue of "causality", we should also avoid the temptation of talking or writing about "teachers" as if they were all the same. They are not. Not all are likely to hold the same educational values and beliefs, or be in possession of the same qualities, knowledge and skills necessary to teach to their best and well in changing conditions in the workplace, and all teachers will be challenged to maintain their commitment to their work over the whole course of their careers. Teachers who teach to their best and well can be differentiated from other teachers in their schools, not because they are extraordinary, or as some would claim, "great" but because of their abiding strength of purpose, their passion and courage (Day, 2008; Palmer, 2007) commitment of care (Noddings, 1992), career-long, "growth" mindsets (Dweck, 2008; Faulkner and Latham, 2016), capacities for resilience (Day and Gu, 2014), and their insistence in exercising individual and collective agency (Hargreaves and Fullan, 2012).

Research suggests that teachers who teach to their best and well are attentive to students' academic progress and attainment, but they are not those for whom, *measurement has become an end in itself rather than a means to achieve a good education in the fullest and broadest sense of the term*' (Biesta, 2015: 83). These teachers are driven by strong "moral" and "ethical" purposes (Day, 2017), regardless of personal, and professional circumstance. These purposes are at the center of their understanding and application of their responsibilities to act in the broader rather than narrower interests of the students. They inform their motivations, purposes, actions, and professional identities (Day et al., 2007; Nias, 1981); and they "enact" rather than "implement" externally initiated reforms, interpreting and contextualizing, rather than thoughtlessly or coercively complying (Ball et al., 2012). "Good" teaching has been described also as being more than assisting students to achieve high test scores. Rather, it consists of a combination of three elements: *logical acts* (explaining, interpreting, correcting, demonstrating); *psychological acts* (motivating, encouraging, rewarding, punishing); and *moral acts* (honesty, courage, tolerance, compassion, respect, and fairness) (Palmer, 2007; Fenstermacher and Richardson, 2005).

The synchrony between teachers and students indicates how much rapport they feel; studies in classrooms show that the closer the movement co-ordination between teacher and student, the more they feel friendly, happy, enthused, interested, and easygoing while interacting ... [the level of] ... Synchrony reflects the depths of engagement between the parties ...

Goleman (1995: 116–117).

A key factor that underpins the work of teachers who teach consistently to their best and well, is their inner strength of educational purpose, their "call to teach" (Hansen, 1995). Self-efficacy and agency are characteristics of these teachers. They are expressed in their strong sense of care about every student, an emotional commitment that goes beyond any contractual obligation to care for.

To these teachers, relationships are as important as rationality. They exercise professional empathy (apprehending another's reality), where their understandings result in context-sensitive action in the classroom.

Research consistently reports that teachers who develop and sustain a willingness and ability to teach to their best and well, demonstrate a strong sense of efficacy and agency as, within clear moral/ethical sets of values and educational beliefs, they navigate changes in their personal, professional, organizational and policy environments, while moving through different life phases and working contexts. What differentiates teachers who are able to teach to their best and well from others is that:

When faced with obstacles, setbacks, and failures, those who doubt their capabilities slacken their efforts, give up, or settle for mediocre solutions. Those who have a strong belief in their capabilities redouble their effort to master the challenges

Bandura (2000: 120).

Teachers' individual and collective efficacy (merging diverse individual goals in support of common organizational goals) is closely associated with their individual and collective sense of agency (Etelapelto et al., 2013), defined as, "being exercised in particular when professional subjects and/or communities exert influence, make choices, and take stances on their work and/or professional identities" (Etelapelto et al., 2013: 57–58). Many empirical studies have found that high levels of teacher efficacy and agency are associated with a strong sense of professional identity. However, any discussions of the nature of teacher identity must include a consideration of the extent to which individual teachers—and whole schools—may exercise efficacy and agency within changing economic, cultural, and social structures (Hitlin and Elder, 2007).

Changes in external environments and conditions of work which appear to promote narrow, "functionalist", "managerialist dominated" and "technicist" cultures of teaching and learning do not always result in feelings of helplessness among all teachers, or *determine* how all individuals feel or act:

It is not that oppressive structures and discourses do not exist, and that these do not affect teacher professionalism and identity. Rather, it is not necessarily the case that their existence, by definition, must always result in negative effects on all teachers. There is a wide range of international research on improving, effective, and successful schools which demonstrates how teachers mediate, resist, and find productive room to manoeuvre, asserting their individual and collective sense of agency within a sense of positive identity

Day (2018: 67).

To date, there is relatively little large scale empirical research which investigates whether, to what extent, and how teachers build and sustain their willingness and emotional and intellectual capacities to teach to their best and well, and, in doing so, challenge the claims of some academics that in recent times, their abilities to make professional judgments (decisional capital) and exercise self-efficacy and agency within a strong, positive sense of professional identity have been "subverted" and that, the "technical" aspects of teaching are now privileged ... to the neglect of the relational (Sachs and Mockler, 2012: 33).

Teachers' lives: different journeys

Teachers vary in the students they serve, the extracurricular duties they take on, the amount of time they have for planning ... Certainly some teachers are better able than others to accommodate the variety of stresses and strains they may face in their work. And to the extent that this is so, these differences may be due to differences in personal qualities ... We measure and track their value-added test scores but we do not measure their teaching loads, planning time, student absences, proportion of difficult to teach or resistant students, frequency of outside interruptions, access to textbooks or equipment of good quality.

Kennedy (2010: 596–597).

Over the last 20 year period especially, researchers have identified differences between teachers' work experiences, career trajectories, and teacher quality, and connected these to the positive and/or negative effects of national policy changes, conditions of service, school cultures, personal biographies and life changes. The most influential early research which focused on enhancing understandings of Swiss secondary school teachers' lives (Huberman, 1993) identified five different career phases from early survival and discovery (year 1–3), through stabilization (year 4–6), experimentation (year 7–8), serenity and conservatism (year 19–31) and disengagement (year 32+). Huberman found differences, however, between and within these groupings. Later he built upon this research, noting a "dynamic ebb and flow" (p. 42) among teachers as they responded to changed personal and organizational contexts. Subsequent research identified associations between teaching experience and levels of commitment (Day et al., 2007; Ben-Peretz and McCullough, 2009; Worth et al., 2018), and teachers' "best loved selves" (Craig, 2013).

Building on Huberman's classic work, a large scale four -year nationally representative mixed methods study of 300 teachers in 100 primary and secondary schools in England of teachers' work and lives and effectiveness was undertaken. It identified six "professional experience phases": commitment, support and challenge (year 1–3), Identity and efficacy (year 4–7); growing tensions and transitions (year 8–15); challenges to motivation and commitment (year 16–23); challenges to sustaining motivation (years 24–30); and declining motivation (year 31+).

Eight of the most important findings from that research were:

- (i) Within each professional experience phase there were teachers whose commitment to their work was rising, stable and declining
- (ii) Years of teaching experience did not necessarily lead to increased expertise
- (iii) There were perceived and significant statistical relationships between teachers' levels of commitment, capacities for resilience, and effectiveness in terms of student measurable attainments over a three year consecutive period
- (iv) Commitment and capacities for resilience varied over time within and between their professional experience phases
- (v) Teachers' sense of professional identity was an important part of their sense of professionalism
- (vi) This was influenced positively or negatively by policy, organizational, and personal/professional contexts
- (vii) School contexts (i.e., Supportive/unsupportive leaders, and or colleagues, student classroom behavior), and personal life events were perceived to have the biggest influence on teacher commitment, capacity for resilience, sense of positive or negative professional identity, and effectiveness.
- (viii) Despite what might be considered as considerable pressures to abandon or at least minimize their commitment to broader purposes of education, most of these teachers continued to uphold them (Day et al., 2007).

In subsequent years, policy interest in the impact of teacher commitment, professional identity, resilience, and relationships between these with their willingness and ability to teach well and to their best (effectively) has grown, particularly in countries which face continuing difficulties in teacher recruitment and retention. The next part identifies what research continues to show are the most important features that they exhibit, which underpin and inform their work, and what are the positive and negative influences that challenge or support these: (1) Commitment; (2) Professional identity; (3) Resilience; (4) School Leadership

Commitment

Commitment has been defined as a predictor of teachers' performance, as well as having an important influence on students' cognitive, social, behavioral, and affective outcomes (Louis and Kruse, 1998; Day et al., 2007). It is a term often used by teachers to describe themselves and each other, and is a part of their sense of professionalism.

In this article, I take commitment to mean a strong and enduring confidence by teachers that they can make a positive difference to students' motivation to learn, engagement in learning, academic progress and personal and social well-being; and that this will, in the longer term, also contribute to the "good" of society (moral/ethical/spiritual purpose). Teacher commitment has been identified repeatedly over the years by scholars as one of the most critical factors in the positive difference that teachers' can bring to their work. Crosswell (2006) proposed six "indicators" of teacher commitment:

- passion for a certain aspect of teaching and the teachers see it as a motivating or a sustaining factor
- investment of extra time—time donated beyond the usual contact hours with the students
- focus on individual needs, both socio-emotional and academic, of the students.
- maintaining professional knowledge and quest for further professional learning
- taking responsibility for transmitting knowledge and attitudes, values and beliefs to prepare students to take responsibility for future endeavors.
- willingness to engage through interaction with colleagues in the school and its community members, and to stay working at a particular school as an organization.

More recently, Thein et al. (2014) identified four inter-related dimensions of teacher commitment. It is interesting to note their inclusion of commitment to school as one of these

1. *Commitment to teaching*: related to the psychological link between teachers and their teaching work. This can be checked by seeing the willingness of the teachers in exerting significant efforts in being engaged in teaching and in devoting extra time for the students for improved results.
2. *Commitment to students*: related to the involvement and responsibility assumed by teachers in student development and achievement by making learning meaningful.
3. *Commitment to school*: related to the teachers associating their own beliefs and values with the goals and values of school and remaining with the school for the achievement of these goals.
4. *Commitment to the profession*: related to the extent of motivation the teacher has to developing their knowledge of teaching and learning.

We can see from the above what researchers have found to be the values, characteristics and behaviors of committed teachers. However, what they do not include are the mediating influences of their environments, how these might change over time, and how teachers themselves may change. It is self-evident that the depth of teacher commitment will be associated with the strengths of their beliefs and purposes, their self-efficacy, agency and professional identity, and that building and sustaining these may be enhanced by their capacities for resilience, or diminished by school contexts (student behavior, collegial and administrative support, parental demands). Nevertheless, it seems that committed teachers are able to teach to their best and well despite, as well as because, of factors in their working environments. They possess what has been defined as "professional capital". Hargreaves and Fullan (2012) proposed that professional capital combines "human" capital (qualifications, experience, knowledge and skills),

“social” capital (frequent, productive interactions with colleagues inside and outside school), and “decisional” capital (the ability to make wise judgments about teaching and learning in the classroom). Investment in the development of professional capital, they suggest, is necessary if students are to be taught well.

When the vast majority of teachers come to exemplify the power of professional capital, they become smart and talented, committed and collegial, thoughtful and wise. Their moral purpose is expressed in their relentless, expert driven pursuit of serving their students and their communities, and in learning, always learning, how to do that better

Hargreaves and Fullan (2012: 5).

As evidence to support associations between human and social capital and student achievement, they drew upon empirical research which found that teachers with high social capital increased their students’ mathematical scores by 5.7% more than teachers with lower social capital, and that students of teachers with both high human capital and high social capital, achieved the highest gains. Indeed, they found that so-called “low ability” (low human capital) teachers were able to achieve as well as teachers of so-called “average ability”, when they had strong social capital in their school (Leana, 2011: 34). Although a direct cause and effect relationship between professional capital and thoughtfulness and wisdom is unlikely, it is reasonable to suggest that there will be close associations.

Professional identities: sites of struggle

Developing a professional identity involves finding a balance between the personal and professional side of becoming a teacher

Pillen et al. (2012: 8).

Professional identities have been defined by some as “sites of struggle” (MacLure, 1993: 314). Teachers’ identity is now recognized as not necessarily being fixed over a career, but negotiated in changing personal, social, organizational and policy contexts. One or more of these may threaten to disrupt the stability of existing identities (Beijaard et al., 2004). It is the extent to which teachers are willing and able to manage the uncertainties of short, or longer term disruptions to their existing working lives that will determine whether their professional identities become or remain positive and stable, or become or remain negative-stable, or negative-unstable. Their ability to retain a strong sense of identity may be mediated positively or negatively by colleagues, school leaders, their performance in the classroom, their students’ responses, or the strength of their vocation. If, for example, alongside their confidence in their content and pedagogical knowledge, they have strong professional capital, then their ability to navigate the winds of change in their schools and personal lives is likely to be enhanced (Holstein and Gubrium, 2000).

Understanding teachers’ professional identities is important because they are sources of meaning for them. As with commitment, research recognizes the relationship between the rational and the emotional. Sustaining a strong and stable professional identity “requires the management of both by the individual” (Zembylas, 2005: 24). Their sense of professional identity may motivate them if they are positive, or de-motivate them if they are negative. They may contribute to their high self-efficacy or to low self-esteem. Professional identity should not be confused with “role”, which is the means by which people’s functions within organizations are organized (Castells, 2004). The ways in which teachers form their professional identities are not only influenced by how they feel about themselves and how they feel about their students (James-Wilson, 2001), but also about how they feel about themselves as members of a wider communities of teachers, the success of their work in the classroom, their relationships with colleagues, and the value that is placed upon them by their school leaders, parents, governments, and the community at large.

Teachers’ identities are a core element of their professionalism. Hoyle’s early description of the key differences is worth recollecting:

By restricted professionalism, I mean a professionalism which is intuitive, classroom-focused, and based on experience rather than theory [The teacher] is unencumbered with theory, is not given to comparing his work with that of others, tends not to perceive his classroom activities in a broader context, and values his classroom autonomy The extended professional, on the other hand, is concerned with locating his classroom teaching in a broader educational context, comparing his work with that of other teachers, evaluating his own work systematically, and collaborating with other teachers

Hoyle (1980: 49).

There is now considerable body of research which extends and nuances what Hoyle called “extended professionalism” to teachers with a “strong professional identity.” Not all teachers always demonstrate the same degree of professionalism. Some, for example, may show by their attitudes and behaviors, “restricted” professionalism, while others may show “extended” professionalism; and this may vary depending on circumstance at different points in their professional experience, and for different reasons.

If they have the support of colleagues, leaders and good relationships with students, then this will strengthen them further and reinforce their commitment and capacities for resilience.

Resilience

Resilience is not a quality that is reserved for the heroic few. Rather, it can be shared by many ... teachers who remain ... committed to serving the learning and achievement of the children on an everyday basis and also over the course of their professional lives

Day and Gu (2014: 3).

Early studies of resilience originated in the disciplines of psychiatry and developmental psychology, and either focused upon examining the personalities or traits of children or adults who had suffered significant physical or mental traumas and recovered (Howard et al., 1999). Researchers sought to understand how and why some were able to adapt and thrive, while others were not. More recently, the focus changed to one which sought to understand the positive characteristics of resilient people, in order to inform what kinds of interventions would be most likely to assist recovery. At this point, resilience began to be understood not only as a (fixed) personality trait, but as a characteristic or quality which could be enhanced so that it could function as a reserve that could be drawn upon, "to improve the odds of successful coping and survival ... through experiences of positive emotions" (Fredrickson, 2004: 1367–9).

A capacity for resilience has been found to be associated with optimism, altruism, self efficacy and emotional wellbeing—all qualities of teachers who teach well and to their best. For teachers, resilience:

... is not primarily associated with the capacity to "bounce back" or recover from highly traumatic experiences and events but, rather, the capacity to maintain equilibrium and a sense of commitment and agency in the everyday worlds in which teachers teach

Day and Gu (2014: 26).

Thus, resilience has become recognized as a social construction, influenced by multi-dimensional factors that are likely to be unique to particular contexts (Unger, 2004). When examined in teachers' working contexts, researchers have found that:

- (i) Resilience is not a quality that is innate
- (ii) "Coping" with the challenges of classroom and school environments is necessary but insufficient if teachers are to teach to their best and well. They need to manage these successfully
- (iii) The extent to which they are willing and able to do so is influenced directly by their sense of professional identity (commitment, self-efficacy and agency), and indirectly by their colleagues' support, school leaders, and their personal support they receive outside the school
- (iv) Teachers' capacities for resilience are likely to fluctuate over the course of a career
- (v) Because schools are socially dynamic settings (in the classroom, in the staffroom, in the playground), and teaching to one's best and well demands relational and intellectual connectedness, teachers need to be able to draw upon reserves of resilience on an everyday basis

There is no doubt that teaching can be a stressful work. Classroom and staffroom relationships are not always predictable (Patterson and Kelleher, 2005), and may not always be productive, personal life circumstances may be problematic, school leaders may not always be understanding or supportive, policy driven changes, or challenges of career role or phase may challenge teachers' beliefs and practices (Day and Gu, 2010; Mansfield et al., 2012). The strength and depth of teachers' commitment may be challenged by one or more of these. Capacities for resilience will vary within and between individuals.

The school leadership influence

So far, this article has cited research which has revealed the complexities of teaching, the positive and negative influences that changing personal, situational and policy contexts exercise upon teachers' commitment, efficacy, professional identities, agency and capacities for resilience. It has posited these are essential values and qualities displayed by those teachers who, often against the odds, remain persistently willing and able to teach to their best and well. What they do, how they feel about what they do, how they do it, and how successful they are, however, will not be independent of significant others. Among the most significant will be school leaders. Their success is likely to be associated, directly and indirectly, with the quality of leadership that they experience.

There is voluminous and varied research on school leadership, and much of this focuses upon principal leadership, since researchers seem to agree that it is they who are primarily responsible for establishing the vision, values, direction, structures, relationships, and learning cultures of the schools that they lead. Culture is referred to as "the way we do things around here", the patterns and expectations that, "permeate everything: the way people act, how they dress, what they talk about and consider taboo, whether they seek out colleagues or isolate themselves, whether they work together" (Deal and Peterson, 2016: 7). Research suggests that the nature of the culture can influence teachers' physical and emotional retention through, for example, strengthening or weakening ties of loyalty and contributing positively or negatively to the strength of teachers' commitment; that culture is dynamic, and can change; and that school principals are primarily responsible for creating and working with it (Waldron and McLeskey, 2010).

Research on what is known as “effective” and “successful” principal leadership has grown exponentially over the last thirty years, and a large corpus of knowledge is now accessible. Much of this consists of competing leadership “models”. There are so many, that one researcher critiqued their proliferation:

Within the literature on school leadership there also remains an overwhelming endorsement of one-style-fits-all leadership, often accompanied with varying degrees of evangelical zeal. Promoted are a range of adjectival leaderships: “democratic” leadership, “strategic” leadership, “breakthrough” leadership, and so on. While we know that leadership does not automatically take on a new meaning simply when a new adjective precedes the term, there remains a predominant view that the “right” leadership style, if found, practiced and implemented, in a strong, unequivocal manner will make all the difference

Mulford (2008: 38).

Since then, the most influential adjectival “models” have been associated with “transformational” (Leithwood and Riehl, 2005) and/or “instructional” leadership (Robinson et al., 2009). Within the “transformational” leadership model, Leithwood and Riehl identified core practices of successful principals:

- (i) Setting directions: Leaders set a clear direction by developing and communicating shared goals that encourage a sense of common purpose and high performance expectations
- (ii) Developing people: offering teachers intellectual stimulation and individual support
- (iii) (Re) designing the organization: designing their schools as professional learning communities, by modifying school structures and processes to increase professional collaboration and dialog among teachers and to improve home school relationships
- (iv) Managing the teaching and learning program

Both transformational and instructional models have been found to characterize leadership which has achieved and sustained success (Marks and Printy, 2003; Day et al., 2016). Both highlight the importance of the principals’ values, beliefs and practices in shaping the preferred workplace culture and meeting successfully external requirements (Day et al., 2011; Gu et al., 2014). That body of research reports that principals influence students’ learning progress and achievement indirectly, through their direct influence on teachers (Leithwood et al., 2006). A “best evidence” synthesis of the available quantitative research internationally identified five key dimensions of “effective” leadership, calculated statistically by “effect size”. Of these, “encouraging and participating in professional development” had the highest effect size of all (0.84). Leithwood et al. (2010), extended the dimensions of successful leadership by conceptualizing its indirect influence as flowing along four paths toward student learning: the rational, emotional, organizational, and family paths. Leaders, they have suggested, increase student learning by improving the condition or status of the variables on all these paths. This added to research which identified the importance of the socio-cultural dimension of successful leadership (Mulford and Silins, 2011; Bennett et al., 2014). Researchers in the USA, and England have also found reliable associations between qualitative and quantitative elements of successful leadership and teaching. For example, a key feature of successful, sustained improvement in students’ achievements in reading and mathematics in elementary schools in the USA is “relational trust” between teachers, principals and teachers, and students and teachers (Bryk and Schneider, 2002; Tschannen-Moran, 2014); and, noted earlier in this article, statistically significant associations between teacher commitment and student performance in examinations in primary and secondary schools in England have been found (Day et al., 2007).

There is no space in this article to detail all the merits and demerits of leadership models, though like all leadership models, they are general, do not, and cannot represent the nuances of successfully leading what have become characterized as “complex adaptive systems” (CAS), defined as, “systems that adapt and evolve in the process of interacting with dynamic environments” (Merali and Allen, 2011, cited in van der Steen et al., 2013: 556). In these authors’ views, thinking of schools as complex adaptive systems re-defines linear cause and effect relations as “reciprocal and interactive.” Rather than seeking direct cause and effect relationships between different factors, what van der Steen et al. [p. 55] term as “linear conceptions of causality”, an alternative body of leadership research has sought to understand how a range of factors interact and influence each other in predictable and unpredictable ways. These leadership studies are based upon an acknowledgment of schools, and therefore, relationships within schools, as complex adaptive systems. They have found that:

the process of organizing involves developing relationships from a shared sense of purpose, exchanging and creating information, learning constantly, paying attention to the results of our efforts, co-adapting, co-evolving, developing wisdom as we learn, staying clear about our purpose, being alert to changes from all directions

Wheatley (2005: 27).

Researchers who are members of a twenty five country “International Successful School Principalship Project” (ISSPP) network have identified successful leaders as those who focus upon managing a range of interactive variables and having much broader purposes than raising the academic profiles of their schools. Successful schools have been found, for example, to strive to educate their pupils by promoting positive values (integrity, curiosity, compassion and fairness), love of lifelong learning, as well as fostering citizenship and personal, economic and social capabilities (Mulford and Silins, 2011; Ishimaru, 2013; Day and

Leithwood, 2007). These social outcomes are deemed by successful leaders to be as important as fostering students' academic outcomes (Robinson et al., 2009; Bryk et al., 2010; Sammons et al., 2011; Bruggencate et al., 2012). The findings echo those of Biesta (2015), who claims that the purposes of schools include but are much broader than the "functional" Seeking to judge school success in those terms is likely to result in a narrow, possibly oversimplified, and even distorted understanding of principals' relationally oriented work with teachers. As Finnegan and Daly have observed:

... our findings suggest that the structure and quality of social relationships within schools ... play a crucial role in schools' capacities for organizational learning and improvement

Finnegan and Daly (2012: 65).

Teachers who are willing and able to teach to their best do not do so in isolation of the prevailing school culture. It is important to note, also, that *personal efficacy* beliefs are not fixed or necessarily stable, but subject to social influence, as is the capacity for resilience, agency and commitment and professional identity. Successful leaders are those, research suggests, who attend to these, develop a synergistic interplay between vision and values, strategies, actions and interpersonal relationships (Day et al., 2016), who create and sustain a climate of trust, foster individual and collective ambitions to improve, and build teachers' intellectual and emotional capacities through ensuring opportunities for inter-connections between staff and between staff and students and staff and parents (Mitchell and Sackney, 2000)—in short, provide every opportunity to teachers to teach to their best and well, in the knowledge that it is the teachers who have a direct effect upon student learning, progress and achievement through the quality of their relationships and ability to stimulate new knowledge generation.

Conclusions

The research reported about teachers who teach to their best and well in this article is located in the psychological, sociological, organizational, national policy, and school leadership contexts in which they work. In doing so, it reveals the personal, organizational and policy challenges which they face and overcome through their constant commitment to their educational values and beliefs, their resilience, professional identities, self-efficacy and agency. Their ability to do so is, research reveals, enhanced by the quality of school leadership. Research reveals the importance of leadership support, in particular by the principal in creating and managing cultures of trust and providing informal and formal opportunities for renewal, in conceptualising good teaching as encompassing the person in the professional. Teachers who teach to their best and well in today's contexts possess more than the subject knowledge and technical competences associated with the notion of teaching as a "craft," and fulfilling only "functional" purposes. Debates about the relative importance of "craft" over "artistry", "competences" over "qualities", or "compliance" over "commitment," are unhelpful in defining characteristics of "good" teachers and good teaching, since they oversimplify the complex nature, purposes and practices of "good" teachers and "good" teaching. While narrowly framed competences are rightly emphasized as being vital for "good" professionals, by themselves they do not meet the requirements of good teachers and good teaching. To fully understand these requires an examination of teachers' motivations, commitment, professional identities and capacities for resilience over a career. Good teaching by good teachers will include meeting sets of external and professionally identified capabilities or standards related to their expected contribution to students' learning and academic progress and attainment, but it is also more than this. Schools are socially interactive places in which emotions are embedded, and so classrooms demand teachers' cognitive and emotionally skilled engagement (Schutz and Zembylas, 2009; O'Connor, 2008). Good teachers educate the "hearts" of students as well as their "heads".

To teach to their best and well, teachers will need to possess and apply context sensitive combinations of both task and student-centric moral/spiritual and ethically embedded values, personal and professional qualities and skills, deep knowledge of subject and student, enduring commitment, a strong sense of professional identity, and a capacity for resilience which will enable them to authentically care for the student as person, in the knowledge that there is a symbiotic relationship between "cognition" and "affect", the emotional as well as cognitive selves. In doing so, they need the support of their colleagues and their leaders. Yet, even now, policy makers and even school principals whose support is necessary in different phases of their professional lives, seem not yet to fully understand that educating teachers to teach to their best and well means focusing more closely upon enhancing their levels of commitment, positive sense of professional identity, efficacy and agency, and building their capacities for resilience—in short, educating the person in the professional.

Introduction

Teaching has been increasingly considered a physically and emotionally challenging profession (Hargreaves, 1994; Kyriacou, 2000; Troman and Woods, 2001). Therefore, teacher stress, job burnout and attrition have been important topics in international research on teacher professional development for more than two decades (Imazeki, 2005; Kyriacou, 1987, 2001). Studies have explained why some teachers gradually lose their teaching enthusiasm and stagnate or leave. Although teachers are confronted with challenges, many maintain their passion and commitment and try their best to teach well (Gu and Li, 2013; OECD, 2005). An international teacher survey showed that 78% of lower secondary teachers would still choose teaching if they were making a new career decision (OECD, 2014). However, there has been very little research concerning why these teachers maintain consistent enthusiasm and strong resilience despite the challenges in schools. Teacher resilience is thus a relatively new area that explores why teachers show tenacity and adaptability when they face pressure, challenges or adversity (Beltman et al., 2011). The focus on resilience provides researchers with a positive psychological perspective to develop methods of helping teachers maintain their enthusiasm and passion in adverse environments and ways to support teachers' professional development (Beltman et al., 2011). While researchers have attempted to identify personal and contextual risks and protective factors that influence teacher resilience, studies of how teacher resilience develops across their professional life phases and the factors influencing the development of teacher resilience remain insufficiently explored.

The rationale for our focus on teacher resilience in the Chinese context requires further explanation. First, resilient qualities have been emphasized for thousands of years in Chinese traditional culture. As part of character development, resilience has always been used to describe people who are indomitable and unyielding in adversity. For instance, "I Ching" (易经, one of the oldest Chinese classics) notes, "As heaven's movement is ever vigorous, so must gentlemen ceaselessly strive along" (天行健, 君子以自强不息) (Li et al., 2019). Chinese teachers have been immersed in such resilience education from a young age, which leaves potential impact on the way they respond to challenges in their work. In a context of rapid economic development, policy and social changes, Chinese teachers are confronted with many education reforms and challenges such as heavy workload, moving from an examination-oriented environment to student-centered learning assessments, and managing high parental expectations (Gao,

2008; Liu and Onwuegbuzie, 2012). Considering such work conditions, aforementioned resilience culture may have an influence on Chinese teachers' attitudes towards these challenging external requirements. Given that Chinese teachers' resilience is an under-researched area, it is necessary to amplify related studies in Chinese context.

Second, we were motivated by the need to explore how teacher resilience is related to the retention of quality teachers in the Chinese education system. Until the end of the 1990s, Chinese teachers were permanent employees by local educational authorities (Gao, 2008). Although new contract employment practices have been adopted in schools over the last decade, teaching is still seen as a stable profession. While the rates of teacher attrition in China are much lower than other countries in general (Gu and Li, 2013; Liu and Onwuegbuzie, 2012), the loss of rural teachers poses a serious problem. However, the loss of rural teachers in China poses a serious problem. Due to the long-standing urban-rural divide, rural schools are often staffed with significantly fewer quality teachers than their urban counterparts (Han and Li, 2013). As Chinese teachers in rural areas face higher pressure and more challenges, how do they maintain enthusiasm and commitment to teaching in times of change? This crucial question makes research into the resilience of Chinese rural teachers vital, especially as the answers may provide productive insights for school leaders and policymakers to enhance teaching and learning quality.

Questions remain about how and why teachers maintained resilience in hard-to-staff schools. Drawing on analysis of interview results from 12 rural teachers from a national project called *Special Teaching Position Plan* in a county in remote southwest China, this paper examines teacher resilience in hard-to-staff Chinese rural schools. We aim to explore the factors that affect resilience across the rural teachers' professional life phases so as to consider implications of these insights for the professional development of teachers working in hard-to-staff schools. The specific research questions are: What are the characteristics of rural teachers' resilience development across their professional life phases? How do internal and external factors influence rural teacher resilience?

Policy context for hard-to-staff rural schools in China: an alternative hiring plan of *Special Teaching Position* (特岗计划)

An alternative hiring policy is a teacher supplement strategy used to solve the serious problems of teacher shortage and limited budgets (Chudgar et al., 2014). These alternative routes may have different names, but their central goal is to staff schools with sufficient and qualified teachers (Liao, 2019).

Aiming to attract teachers to economically underdeveloped rural areas, the policy on *The Implementation of the Special Teaching Position (STP) for School Teachers in Rural Compulsory Education* was issued by the Chinese government in 2006. The implementation principles are stipulated for a fixed-term and offered all participating teachers the opportunity to be tenured after three years. Central and local governments are involved in the recruitment of STP teachers, and central government provides the funds to these teachers for their first three years. Provincial governments take responsibility for matters like analyzing the number of STP teachers needed, setting up the recruitment criteria and organizing recruitment examinations and interviews (Liao, 2019). Local governments are responsible for the management and professional development of all STP teachers and pay for the tenured STP teachers' salaries from the fourth year (Ministry of Education of China, 2006).

Even though alternative teacher hiring policies are not uncommon worldwide, the STP is different from those used in other countries, and the Chinese government invested considerable support in the plan. This support can be reflected in the investment of special funds and the number of STP teachers. From 2006 to 2015, the central government arranged nearly 30 billion CNY for the STP plan and recruited more than 570,000 STP teachers. Since the implementation of the STP in 2006, nearly 300,000 STP teachers have been recruited to more than 30,000 rural schools in 22 provinces in Chinese central and western regions, and the retention rate had reached 87% for three consecutive years. STP teachers face many challenges, including their work-life balance. Liao (2019) described the emerging phenomenon of "weekday rural teachers, weekend urban spouses and parents" faced by STP teachers who stayed in rural schools. Inconveniences associated with daily living are a continual challenge as remote rural schools lack sufficient resources, are far from the city and do not satisfy teachers' basic needs (Wang et al., 2017).

Conceptual framework

Conceptualizing teacher resilience

The concept of resilience originates from psychiatry and developmental psychology which study personality characteristics of children who adapt well despite being in a disadvantaged environment (Howard et al., 1999). These studies have found that some children living in high-risk environments have good adaptability. Instead of being overwhelmed by difficulties or challenges, they adapted to overcome difficulties and develop positively (Masten, 2001). Early resilience research paid attention to both static internal protective factors (e.g., optimism, humor, and persistence) and external protective factors (e.g., seeking help and social support) influencing individuals' strengths and potential (Garmezy, 1984). At the same time, some researchers believed that resilience reflected knowledge, abilities, attitudes, traits and skills that could protect individuals from harm irrespective of circumstances (Garmezy, 1985). Scholars found that simply focusing on protective factors is insufficient to fully understand individual resilience, or devise effective strategies to support its development (Mansfield et al., 2016). Thus, researchers

started to pay attention to the interaction between protective and risk factors, aiming to reveal the relationship between internal and external factors that affect the development of resilience.

Four main definitions of teacher resilience can be summarized from the literature. The first is the process view, that is, teacher resilience is a dynamic process observed when teachers face a complex and rapidly changing external environment (Luthar et al., 2010). For example, some researchers pointed out that resilience developed and changed dynamically and was a process of interaction between individuals and the environment (Richardson, 2002). The second is the ability view, which sees teacher resilience as a kind of ability to manage an uncertain teaching situation and maintain a sense of commitment and responsibility (Gu and Day, 2011). From this perspective, resilience is regarded as to withstand high levels of destructive change while exhibiting few negative behaviors (Werner, 1995), recover from a negative experience and adapt flexibly to the changing environment (Lazarus, 1993). Some researchers described resilience as the positive trait that helps individuals overcome difficulties, face adversity, and continue to live a meaningful life with a healthy attitude (Turner, 2001). These researchers tended to regard resilience as an individual ability and cognitive or emotional psychological traits, including personality traits and self-concepts (Rutter, 2000). The third perspective is the result view, which means, teacher resilience is the result of adaptation, emphasizing teachers' positive condition after experiencing adversity (Tait, 2008; Masten and Coatsworth, 1998). In other word, resilience is not a fixed ability but the result of the interaction between the individual and the environment (Johnson and Wiechelt, 2004). The fourth is the multidimensional view. Teacher resilience is constructed by the combined action of individual and environmental factors could be understood as a comprehensive body of ability, process, and results (Luthar et al., 2010).

In summary, the process view emphasizes the dynamic and developmental nature of resilience; the ability view focuses on the importance of individual factors, while the result view stresses individual development. The multidimensional view is a synthesis of the other three views regarding teacher resilience as process, results and ability.

Factors influencing the development of teacher resilience

Researchers began to explore the relationship between protective and risk factors from the 1990s and proposed many models to describe how protective factors reduce the disadvantages caused by risks. In 1990, Rutter suggested that research should explore the development and situational mechanisms of the protection process (Kaplan, 1999). In subsequent studies, the interaction between the environment and the individual was emphasized. Researchers proposed that resilience was not a fixed or absolute ability that enabled individuals to resist stress or overcome difficulties whatever the situation is. In fact, resilience and its effects could change as individuals interact with the environment. (Rolf et al., 1990). This view is supported by Rutter (Rutter, 1985) who believed that the operation of the protective mechanism was the result of the interaction between the environment and the individual. Working together, both aspects could buffer the negative impact of risk factors on the individuals.

Studies have explored the influence of risk and protective factors on teacher resilience development. Risk factors refer to physical, psychological, cognitive or environmental factors that hinder teacher professional development, even leading to burnout and other undesirable results (Beltman et al., 2011). Heavy teaching workload, classroom management difficulties, lack of support and limited resources are all potential threats to resilience development. Beltman et al. (2011) summarized previous research, dividing the risk factors into personal and environmental risk factors. Personal risk factors include negative self-belief, difficulties encountered when seeking help, and the contradiction between personal beliefs and reality. Environmental risk factors include pre-service teacher education environment (e.g., unstable curriculum structure, inappropriate training curriculum system, or excessive academic pressure), family environment (e.g., negative pressure, lack of family support, or the imbalance between family and work), school or classroom environment (e.g., classroom management difficulties, destructive student behavior, or time-consuming non-teaching work) and professional work environment (e.g., professional development challenges, lack of practical teaching experience, work pressure, lack of support from school leaders, or lack of practical training) (Beltman et al., 2011). Risk factors can also be considered from a broad social perspective, with external factors such as changing external policies, teacher accountability, decentralization and education reforms influencing teacher resilience (Kelchtermans, 2005). Challenges or pressures affecting the development of teacher resilience teachers are mainly from three aspects: the personal level (e.g., lack of confidence, physical health challenges such as insomnia or anxiety), the school level (e.g., lack of sufficient resources and limited supportive leadership relationships), and the social level (e.g., threats from neighbors) (Maring and Koblinsky, 2013). The pressure teachers face will also continue to change with teacher development. Therefore, it is very important to clarify the source of pressure at each stage of teacher development to identify the risk factors of teacher resilience.

Protective factors can interact with risk factors to reduce or eliminate their negative influence. Protective factors may include personal altruistic attributes, strong internal motivations, and support from school leaders, peers or family. Some researchers pointed out that protective factors were more important for teacher resilience than risk factors (Knight, 2007). Therefore, many studies explored the resources that could enhance teacher resilience by asking what helped teachers maintain their teaching enthusiasm and quality. These studies can be roughly divided into two groups: those that focus on personal factors and those centering on environmental aspects. Personal factors include motivation (Watt and Richardson, 2008) and self-efficacy (Hoy and Spero, 2005), while environmental factors contain professional development (Anderson and Olsen, 2006), instructors (Shank, 2005), and trusted interpersonal relationships with students (Hirschhorn, 2009). Thus, protective factors of teacher resilience consist of internal protective factors and external protective factors. Internal protective factors refer to psychological characteristics and abilities to adapt quickly in adverse environments (Beltman et al., 2011). For teachers, the core internal protective factors are their altruistic motives and strong internal motives for teaching (Beltman et al., 2011). Teachers' self-efficacy is another

important internal protective factor. Day (2008) believes that teachers with strong resilience can be confident and competitive. There are six types of teachers' internal protective factors: (1) personal traits, e.g., gender, sense of humor, strong internal motivation, optimism, emotional intelligence, flexibility, and persistence (Beltman et al., 2011); (2) self-efficacy and self-confidence (Day, 2008); (3) coping skills, e.g., using coping strategies, active problem-solving skills, help-seeking, high-level interpersonal skills, and social support networks (Sammons et al., 2007); (4) teaching skills, e.g., understanding students, being creative, proficiency in teaching, and paying attention to student learning (Yost, 2006); (5) professional reflection and growth, e.g., paying attention to professional development, self-insight, self-evaluation, reflection, professional freedom, and lasting professional learning (Beltman et al., 2011); and, (6) self-care, e.g., taking responsibility for one's physical and mental health and actively creating favorable conditions for oneself (Beltman et al., 2011). The more protective factors he/she has, the better they can recover from adversity and difficulties. It is also important to note that the role of protective factors varies from person to person, depending on the teacher's career, the specific challenges they face and how they respond.

The external protective factors of resilience refer to the resources in the social environment that reduce the impact of individual risk factors. Protective environmental factors that can help teachers recover quickly occur at three levels: school, family, and society. First, strong, caring leadership is the main support resource for teacher resilience at the school level. Strong and caring school leaders are democratic, open, and fair, so that they create a pleasant and comfortable working environment for teachers. They also provide consistent support and timely, positive feedback for teachers, helping them overcome difficulties encountered in teaching and promote their professional development. (Gu and Li, 2013). Especially for new teachers, school leaders could support them by not assigning additional teaching tasks, making sure they are not given difficult-to-manage classes, and recognizing their contributions to the school. Ultimately, strong leaders can improve teachers' teaching effectiveness and professional commitment. The second factor is the proactive support of instructors from the same field, which is especially important for pre-service and new teachers. Mentoring relationships can help new teachers quickly adapt to the school environment and improve their self-reflection and problem-solving skills. Their self-esteem, self-confidence and teaching enthusiasm will be enhanced too. Support from peers and colleagues also plays an important role and can motivate teachers, help them overcome work difficulties, and maintain their enthusiasm, especially when facing difficulties. Finally, students are both a challenge and a source of support for teachers. A positive teacher-student relationship can help teachers overcome difficulties, and contribute to their well-being.

At the family level, the support from family and friends can reduce teachers' worries and enable them to balance work and life. They may then be better able to complete teaching tasks and maintain their teaching enthusiasm. The care of family members can give teachers a platform for emotional adjustment, so as to maintain positive emotion and confidence. At the societal level, it is necessary for society to create an atmosphere of respect and safety for teachers to improve their status. More relevant policies and regulations should be promulgated to promote teacher retention and development as well.

Methodology

Participants

This study adopted criteria sampling (Patton, 2002) and selected 12 STP teachers from rural schools as research participants (Table 1). As the research focused on outstanding or "retainable and teach-well" STP teachers, the participants were required to meet specific criteria. They were (a) teachers who are "retainable", that is, teachers who have been employed for more than 10 years in the same rural school, and (b) teachers who are teaching leaders now. We chose "retainable" teachers because they had shown strong resilience. Recruiting the teaching leaders was not only because they were outstanding STP teachers, but it would also allow us to analyze how teacher resilience changes across different career stages. Given the qualitative emphasis on contextual features, we chose to focus on just one Chinese province to attend to its local features in-depth and investigate how those features impacted the teachers' resilience development. Twelve STP teachers in County B of Province G met the sampling criteria. We approached the 12 teachers in early 2020, and they all agreed to participate in this study voluntarily.

Data collection

Both individual and focus group interviews were held to generate data about STP teachers' resilience development and the reasons for development. The authors visited G province, B county, from October to December 2020, where they conducted face-to-face individual and group interviews with participants. First, researchers provided information about the study, collected basic information about the participants and obtained verbal consent for their participation. Then in-depth semi-structured individual interviews took place with 12 STP rural teachers. Each interview lasted one to two hours to ensure a full understanding of the participants' willingness to stay or leave, as well as factors and key events that influenced their willingness, such as influencing factors and key events, including changes of emotions, attitudes, and agency since they chose to be an STP teacher. A focus group interview with five participants was also hosted to collectively share their experiences and feelings about the development of resilience.

A month later, telephonic or online interviews were conducted based on the preliminary findings. Here, all participants were invited to provide more details about their experiences and feelings. This second round of interviews offered an opportunity to refine the emerging themes and delve deeper into the factors and critical incidents affecting STP teachers. The main interview questions focused on the reasons for choosing a teaching job, as an STP teacher, the difficulties they faced in different career stages in hard-to-staff schools and how they overcome these difficulties.

Data analysis

This study reports primarily on the qualitative thematic analysis of the transcriptions of interviews with 12 rural teachers. The interviews were recorded and transcribed verbatim, and then listened to a second time to add non-verbal information such as changes in the interviewee's tones, moods, pauses, and silences during the interviews. The details supplemented the analysis. The researchers sorted and numbered the original data. In the data collection and preliminary analysis stage, this study mainly used the situational analysis method to describe the rural teachers' resilience development. Initial coding of 12 teacher interview transcripts and a constant comparative approach were used for further interpretation and understanding through sorting, reconstruction and re-coding an agreed but still evolving index. In the stage of in-depth analysis and concluding, the qualitative analysis was performed using MAXQDA software, through which the participants' responses were coded and analyzed with the generic analysis method, involving searching for themes that capture important elements within the data and focusing on the relationships between themes (Nowell et al., 2017).

The validity of the study was ensured through meticulous examination of the data by two researchers. An independent examination of the data was carried out in the beginning of the analysis, and a brainstorming meeting was subsequently convened, focusing on the research questions in light of the interview analysis. Interviews were jointly examined at this stage, in an iterative process, until agreement was reached.

Results

Rural teacher resilience across professional life phases

Taking the progression of the tenacity of rural teachers from STP as the ordinate, and the teachers' working years as the time abscissa, Fig. 1 shows the resilience development of the 12 rural teachers. Five patterns of STP teachers' resilience development emerged: *low-to-high*, *U-curve*, *occasional waves*, *stable development*, and *high sustainable enthusiasm* (Fig. 1 Shown).

Group one: low-to-high

ZHANG and PANG were both reluctant to be STP teachers at first. They passively chose this career under the advice of family members. ZHANG's parents believed that *"teaching is a stable profession"*, and PANG's parents believed that *"being an STP teacher would help me be closer to home"*. As a result, these two teachers were less resilient at the start of their careers. As ZHANG said:

At that time, I didn't want to be an STP teacher at all. My heart was full of resistance. I wanted to leave every day, and I didn't want to stay there for a moment.

PANG also described how eager he was to leave at first. However, both these teachers gradually felt a sense of achievement about their work. ZHANG found that *"children are so cute"* and felt *"a sense of accomplishment"*. These participants noted that teachers' salaries and social status were higher than before, and local people believed that teaching is *"the profession that everyone admires"*. The support from school leaders and colleagues also improved the two teachers' ability to cope with difficulties. In other words, these teachers showed enhanced resilience. Therefore, the resilience development of these two teachers can be characterized as moving from *"low-to-high"*.

Group two: U-curve

Both LIU and CHEN experienced high enthusiasm, disillusionment/loss of ideals and renewed fighting spirit in the professional development process. Their resilience development showed typical characteristics of a *"U-curve"*. The two teachers *"love education"* and were *"also very fond of children"* before starting work. Thus, they were *"full of confidence when they first entered the job, and curious about everything"*. However, the harsh environment of the schools quickly extinguished their enthusiasm. LIU observed:

The environment was so bad that you can't imagine it. At the beginning, the dormitories we lived in were transformed from classrooms. The teaching building was dilapidated, and the floor of the classroom had potholes. There were even all kinds of poultry in the classroom! I was in a very low mood and really wanted to leave.

Fig. 1 Five groups of teachers' resilience development.

Similarly, CHEN experienced serious burnout not long after entering the job – attributed to difficulties in class management and lack of subject knowledge and teaching skills. Gradually, however, the teachers adapted to the work and lives in rural areas. They rekindled their fighting spirit and devoted themselves to teaching because of the harmonious working atmosphere, the gradually improved school environment and most importantly, their love for education and students.

Group three: moderate level with occasional waves

Some rural teachers showed relatively strong resilience throughout their careers with occasional fluctuation. We termed this the “occasional waves” of resilience development in this research. TAN and AN had been passionate about teaching for more than ten years. In recent years, TAN’s increased administrative load was taking up much of her time.

Most of my time is spent dealing with affairs unrelated to teaching, so I am a little tired physically and mentally.

In contrast, AN is “*not a local person*”, and she occasionally wants “*to go back to my hometown*”. Although the two teachers have tend to leave from time to time, they still feel infinitely motivated when they stand on the podium to teach.

Group four: sustained moderate level

The resilience of this group remained a moderate level at each stage – thus, characterized as “sustained moderate level”. JIN and ZHONG can be classified into this type. JIN has been an STP rural teacher for ten years, and has been doing his job diligently. He always overcomes difficulties in teaching or life, but noted:

In fact, I don’t like education much, but I still hope to do my job well. I think it is my responsibility – the matter handed over to me – and I should try my best to do it well.

ZHONG has always responded to problems in teaching – and life – calmly. He takes responsibility for doing his job, saying: “*Fight fire with water. It is a natural feeling, and I don’t think about it so much*”.

Group five: sustained high level

Four teachers v DAI, LI, HE, and MA, have shown sustained high level of resilience throughout their careers, coping actively with difficulties in teaching and life. During the interviews, we found these teachers had the following characteristics in common:

First, all started their jobs with a clear goal: “*desiring to contribute to their hometown*”; “*rural children’s desire for knowledge*”; “*hoping to go back to the village elementary school in my hometown*”; “*born in the countryside and knowing clearly what children in the countryside need*”. Second, they persevered to face difficulties: “*It is normal to meet some difficulties at the start of one’s profession*”; “*From the beginning of my choice in education, I persevered unswervingly*.”; “*When you meet difficulties, you must take the initiative and find ways to overcome them*”; “*If you need to deal with some difficult problems, please consult colleagues or respected teachers in the same discipline*”. Third, all are reflective practitioners: “*Teachers should always reflect on themselves and their teaching, otherwise they will never be able to improve their teaching level*”; “*Frequently conduct teaching research*”; “*Listen to the lessons of experienced teachers, learn class management experience from predecessors, and reflect on yourself from the teacher training provided by the school*”; They showed strong resilience from the outset and had worked hard consistently in their teaching positions for many years. Although these four teachers have experienced many difficulties in their careers, they have always maintained a positive attitude to learning and teaching. They showed strong resilience from the outset and had worked consistently hard in their teaching positions for many years.

Factors influencing rural teacher resilience

Although outstanding STP teachers have built resilience by the later stages of their careers, the levels of their resilience varied at different stages of their journeys. The teachers’ resilience development also showed different characteristics. Why does resilience differ? STP teacher resilience mainly comes from two sources: individual factors and environmental factors. These two factors interacted closely, leading to unique outcomes for each individual.

Individual factors affecting rural teacher resilience

There are four individual factors that affect STP teacher resilience: individual characteristics, internal emotions, professional abilities and life needs. Every aspect shows the interaction between protective and risk factors.

Individual characteristics: suitability for teaching versus non rural life trajectory

The rural teachers’ individual characteristics (e.g., personality, working style, self-efficacy, and background) directly impact upon their resilience. Protective factors are reflected in teachers being “*suitable for teaching*”. Some teachers “*have been confident enough*”,

or “*peaceful about everything*”, or “*have a cheerful personality*”. These positive traits generate enthusiasm to help teachers manage difficulties. Similarly, the teachers’ own style of coping also reflects their “*suitability for teaching*”. For example, one participant said:

I think I should try my best to do all the things I have been told, either not to do them or to do the best. This is my principle.

Similarly, another participant suggested:

I want to make my own mark, so I would not leave if I can’t do it.

Teachers with a high sense of self-efficacy also have a strong ability to rebound when encountering difficulties and show strong resilience. As MA said, “*I am very good at learning. I don’t think there is any difficulty*”. However, “teachable” teachers also face individual risks, such as regional issues, which means they were not born or raised in the countryside. Whether they can adapt and settle in the rural areas is an important factor. ZHANG grew up in the county town, and “*never having lived in such an environment before, there was a big sense of disappointment when I first came here*”. ZHONG had the same feeling. When he first arrived at the rural school, he could not even understand the local dialect and noted: “*Communication is always a problem*”.

For rural STP teachers, the “teachable” characteristic is a protective factor, while the regional problem is the risk factor. Teachable characteristics can stimulate teachers’ inner teaching enthusiasm and improve resilience. However, risk factors like regional problems may affect their decision to stay, reducing their resilience.

Inner emotion: occupational enthusiasm versus career burnout

Some teachers took the position initially with the idea of “*making a contribution to my hometown*” or “*returning to my hometown and devoting myself to local education*”. After starting the job, their inner emotions were reflected in their commitment. As participants said:

I like being with children. That makes me feel energetic.

I am full of expectations for the arrival of every new student.

I always feel a sense of fulfilment when teaching.

After several years, the teachers felt that they “*have strong emotions for the school*” and “*want to change the mindset of more children*”. Inevitably, some teachers experienced burnout during the process. Some teachers said that “*Students are difficult to manage and sometimes I feel very tired*”. Positive emotions give STP teachers a high degree of identification with their work and gradually lead to a sense of belonging and mission. This kind of emotion enables STP teachers to calmly face the pressures of work and life, but burnout consumes their enthusiasm.

Professional competence: reflection versus teaching problems

In terms of professional ability, risk factors are problems encountered by STP teachers in teaching, and protective factors refer to learning and reflection methods for solving these problems. Almost all STP teachers had teaching difficulties when they first entered their jobs. This occurred as they struggled with their new identity as a teacher, or because the subject they were teaching differed from their major. As ZHANG said:

My major was history, so I was not professional enough to teach Chinese.

Faced with such predicaments, excellent STP teachers will find ways to solve the problems. For example, one participant said:

By observing some famous teachers’ classes, analysing how the same lesson is taught, and then reflecting on what is wrong with my class, I improved my teaching skills.

STP teachers may also receive “supports from school leaders and colleagues”, “participate in lectures” or “participate in teaching competitions” to improve their teaching skills. Administrative load was frequently cited as a major hindrance. Some teachers complained that “There are many administrative affairs now. It seems that administration is my job and teaching is the supplement”. Teaching is the teachers’ main task, and whether the problems in the teaching process can be solved smoothly is a key factor for STP teachers to sustain their professional development motivation. Although teaching difficulties cannot be avoided, most outstanding STP teachers could seek solutions and achieve professional growth through active learning and reflection.

Life needs: pursuit of ideals versus shock of reality

Whether the life needs of STP teachers can be met is also an important factor influencing their resilience. Life needs include personal needs (e.g., shopping or travel) and relationships (e.g., taking care of elderly parents, living apart from their loved ones). Almost all the teachers mentioned life needs in their interviews. For example, ZHANG wanted to leave when he first entered the profession because “the accommodation conditions were pretty bad and it was not convenient to go out. Only the principal’s car could take teachers out”. PANG’s reason for wanting to leave was more private: “My parents, children and lover are all in another place”. HE and his spouse do not work at the same place, leading to strong desire to move elsewhere. These teachers faced dilemmas, but none of them left. Their pursuit of educational ideals supported them and encouraged them to deal with the difficulties. As ZHANG said:

“I really don’t want to leave my students. I hope to lead them to see the bigger world”.

Life needs are the basis for individual survival and development, and the tension between reality and their pursuit of ideals is an important factor in their resilience development.

Environmental factors affecting rural teachers’ resilience development

The environmental factors that affect STP teachers’ resilience development mainly include environmental atmosphere, external support and others. The interaction between protective and risk factors is reflected in each aspect.

The effect of significant others: modeling and leading versus negative suggestions

Support from significant others is indispensable in the process of rural teachers’ professional development. Significant others include family members, school leaders, and colleagues. The effect of family members is embodied in their attitudes toward teachers.

My family thinks that teaching is a stable job. In fact, the social status of the teaching profession in the local area is very high, and my family will be proud of me as a teacher.

My father is a teacher. He has been my role model since I was very young, and I hoped to be like my father. Therefore, I chose to go back to my hometown to be a teacher because of my father’s influence. My family also hoped that I could return to work in the countryside.

These show that family members’ suggestions and roles are important in influencing STP teacher retention. The leadership style of respected teachers also has an impact on teacher professional development. Effective leadership and appropriate attention can provide an atmosphere conducive to the development of STP teachers. For example, LIU noted:

The school principal takes good care of STP teachers, especially their work and life and has taken the lead in developing a harmonious atmosphere in the school.

Similar to school leaders, the relationship among colleagues helps maintain a strong momentum for rural teachers’ resilience development. *We often talk about students, life, and the future together. Everyone gets along very well, and it feels like home in the school.* Of course, some rural teachers have received negative suggestions, such as “my family hopes that I can find a chance to transfer back to the county town”. This kind of suggestion may have a negative influence on resilience development.

Environmental atmosphere: Professional atmosphere: positive versus negative atmosphere

The harmonious professional atmosphere is usually created by the harmonious relationship between the STP teacher and others. The professional atmosphere in this study mainly refers to class, school and local atmosphere. For example, some STP teachers said:

It is difficult for me to manage the noisy class. Sometimes I don’t know how to manage the class and how to coordinate the relationship between students. The class is always in a mess, which puts me in a bad mood.

The school atmosphere is great. The headmaster and colleagues are so nice that we are like family and we often cook and chat together.

The local villagers are very nice, and they often give us vegetables and sweet potatoes they grow. Local teacher status is pretty high, and teachers are always respected a lot.

The surrounding environment significantly affects the resilience development of STP teachers. A positive atmosphere can provide STP teachers with the basis for professional growth, and help teachers maintain their optimistic and upward development. On the contrary, a negative environment is an important reason for teacher burnout which is not conducive to supporting teachers to resist pressure and maintain strong resilience.

External support: sufficient support versus lack of support

External support, including professional support and life support, is indispensable for the resilience development of STP teachers. Professional support include the various professional training and learning activities that the teachers participated in after they started their jobs. For example, new teachers would be “guided by experienced teachers” to learn about the experience and later “dispatched to the school,” and take part in “school-wide lesson observation activities” to promote their teaching competencies. Life support refers to the salary, housing, living allowance and other support that STP teachers receive. One teacher suggested that “the salary has increased a lot in recent years, and the standard of living has also improved”. Adequate support can help teachers concentrate on their teaching. In contrast, when this support is lacking due to increased administrative work and lack of development assistance, their resilience is reduced.

Discussion

Teacher resilience has become an important global research field in recent years, but the development of resilience and its influencing factors in hard-to-staff schools remains poorly understood. This study presented several characteristic patterns of resilience development in STP rural teachers, which we described as *low-to-high*, *U-curve*, *moderate level with occasional waves*, *sustained moderate level* and *sustained high level*. These patterns are a result of the interaction result between teachers’ protective and between internal and external factors.

Teacher resilience: a multidimensional and developmental construct

Findings show that instead of being a stable characteristic, the resilience of STP teachers can be developed as they encounter challenges and difficulties throughout their professional development trajectory. It is affected by various sources of teacher resilience at different stages of teacher professional development. Day (2008) summarized the challenges faced by teachers at each stage of professional development based on teachers’ experience: 0–3 years – teacher commitment; 4–7 years – identity and self-efficacy; 8–15 years – adaptation to changes in roles and status; 16–23 years – work-life tension; 24–30 years – maintenance motivation, and approaching retirement/after 31 years – reduction of motivation (Day, 2008). The different challenges faced by teachers at different stages of professional development constitute diverse sources of resilience, that contribute to teacher resilience development. In addition, the resilience development of STP teachers who perform well in teaching has different characteristics. This conclusion is similar to that of other research. For example, researchers pointed out that each teacher’s “resilience story” is unique because resilience is a process in which multiple factors interact in a complex manner (Galea, 2018). Some researchers have also emphasized that teacher resilience is a social construction affected by unique multidimensional factors in different situations (Ungar, 2016). Of the three characteristics of teacher resilience discovered by Day (2017), context can explain the different characteristics of teacher resilience development. Contextual specificity emphasizes that teacher resilience should be understood according to specific family, class, school and work situations (Beltman et al., 2011). Even if STP teachers are in similar professional work situations, their school, family, and class situations are different, and these situations can affect teacher resilience. Studies show that harmonious cultural atmosphere in schools can help enhance the sense of belonging of teachers, strengthen the emotional connection between teachers and other groups, and encourage them to teach for a long term (Wang et al. 2018). Similarly, in this study, non-local STP teachers’ desire to resign is stronger, as they may find it hard to fit into the local culture and establish their identities in the rural schools, which might lead to professional burnout if handled unsuccessfully (Fu and Yao, 2018). Moreover, difficulties in classroom management and teaching encountered by STP teachers due to insufficient preservice preparation are also important factors for a decrease in teacher resilience (Wang et al., 2017). These factors prompt us to consider the living environment, identity development and professional learning of STP teachers when making policies. Therefore it is vital to strengthen STP teachers’ resilience through creating a positive school atmosphere, developing a strong sense of belonging to a school and a region, and providing sufficient professional development opportunities.

Building teacher resilience in hard-to-staff rural schools

STP teachers' resilience is largely the result of the interaction between protective and risk factors and between internal and external factors. Studies indicate that the resilience process involves an interactive relationship between protective and risk factors faced by teachers over time (Beltman et al., 2011) – which coincides with the conclusions of the present research. The interaction between individual and environmental factors as well as that between protective and risk factors also occur simultaneously. Environmental support and significant others can strengthen the positive influence of individual protective factors, thereby enhancing STP teacher resilience (Windle, 2011). In return, individual protective factors can also reinforce the protective effects of the external environment so that teachers perceive changes in the external environment in a more positive way. The transactional socioecological framework has been effectively used to analyze teacher resilience, indicating that teacher resilience is derived from personal characteristics and related to previous experience and specific social and cultural background. In conclusion, teacher resilience results from the dynamic interaction between the internal and external environment (Masten, 2001; Windle, 2011) (as shown in Fig. 3). The implications for policy making are that internal factors of STP teachers should be considered in the selection and recruitment of STP teachers (e.g., personality, motivation, social and emotional ability, teaching enthusiasm, and ability to reflect on learning). Policymakers should also consider external factors to support the development of STP teachers, such as increasing salaries appropriately, providing professional development opportunities, and promoting the living environment of STP teachers.

In short, the resilience development of STP teachers presents complex dynamic changes with continuous interaction between protective and risk factors, and internal and external factors over each phase of the teaching journey. The patterns of resilience development of STP teachers are diverse, and there is no set standard resilience path that can be applied to all. Resilience development involves spiral interweaving and dynamic interaction among individual protective factors, individual risk factors, environmental protective factors, and environmental risk factors which they co-constructed a relationship of tension and symbiosis (shown in Fig. 2). The dynamic interaction ultimately constructs the teachers' resilience. For example, ZHANG loves children and has always had a sense of accomplishment about her work. However, she was born and raised in the city, and the Chinese subject she taught was not her undergraduate major, so she lacked "professional knowledge". However, with favorable national policies and the improvement of rural school conditions, she gradually adapted to rural life and grew in her teaching through her strong learning and reflection skills and the training opportunities provided by the school. ZHANG's "loving children" and "teaching accomplishment" are individual protective factors, while "not enough professional knowledge" and "non-village people" constitute individual risk factors. The external support she received exemplifies environmental protection factors. What is reflected here is the dynamic interaction between the constituent factors in the resilience development, affecting ZHANG's resilience. Just as social learning theory uses personal factors, environmental conditions, learning experience, cognitive emotions and other factors to explain teacher performance, these factors often form unique combinations to determine professional performance. The combinations of factors and interactive methods here help us better understand the dynamic mechanism of the factors building resilience of teachers in hard-to-staff rural schools.

Fig. 2 Schematic diagram of the influence of factors on STP teachers' resilience development.

Introduction

Teachers are thought to be caring, conscientious educators, but they are also trained to be and practice as professionals in education systems that reproduce cis-heteronormativity, alongside white supremacy, colonialism, classism and ableism. For teachers who are also gender and/or sexuality-diverse (GSD), the pursuit to becoming a teacher, doing the work of a teacher, in concert with (or not) navigating their personal lives may present extra and undue burden given that the notion of teacher professionalism historically excludes their full humanity (Khayatt, 1992; Wells, 2018; Keenan, 2021). While a teacher is legally a professional once hired in a public system (in countries/states that recognize teaching as a profession), their development as a professional (i.e., professionalization) continues throughout their career beginning in preservice programs in Faculties of Education and continuing through in-service professional development opportunities as well as elective continuing education in graduate programs. Professionalism is also enforced in quotidian school practice, classroom conduct, and extracurricular expectations both through power relations and panoptic surveillance tactics (Foucault, 1977, 1980). The professional teacher is tasked with upholding dominant ideologies and practices; they are state agents through the schooling system (Khayatt, 1992). It is this process of professionalization that arises from and contributes to public and policy understanding of the teacher as professional that requires interrogation for the teachers whose lives run counter to dominant gender and sexuality categories. For these teachers who are trans, queer, non-binary, and so forth, professionalization not only strategically overlooks, denies, or excludes but also dehumanizes. Even progressive human rights legislation—specifically protection against discrimination on the grounds of sexual or gender identity—do little to guarantee inclusive, fair, or authentic workplaces for trans and queer teachers (Ullman, 2020; Platero and Drager, 2015; Spade, 2015). As Khayatt (1992) claims, “a law never gets to people’s hearts” (p. 207). Globally, the OECD frames professionalism as the path to guarantee the aims of education systems to reach standards of student achievement, promote social cohesion and advance inclusive educational environments. In a paper responding to the challenges of the teaching profession post-pandemic, the OECD (2021) announces institutionalized professionalism, standardization of professional growth through collaboration and technology and the codification of learning as educational goals. To address the massive shortfalls in achievement during the pandemic, these goals are in pursuit of developing and garnering resilience in students to enhance their capacity for learning. Ironically, the resilience of the teacher, specifically who are GSD, is ignored. The teacher as professional is a disembodied component in the educational system.

This paper reviews seminal research on the lives of teachers in K-12 education who are lesbian, gay, queer, bisexual, transgender, non-binary or otherwise gender or sexuality-diverse identifying that provide specific and rich counter-narratives of professionalism through an interrogation of harmful and dehumanizing cis-heteronormative discourses, policy, and practice in schools. Highlighting the experiences of teachers who are sexuality-diverse precedes those who are gender diverse given the chronology of the publication dates. Additionally, a focus on transgender/trans*-formative pedagogies (Platero and Drager, 2015; Keenan, 2021) as a practice of possibilities for undoing the institutional harm of cis-heteronormativity concludes the paper and sets sights on a future of critical, conscious, and constant rethinking of gender and sexuality subjectivity. The paper surveys scholarship on the experiences and understandings of GSD professional teachers across Canada, US, and Australia. First, I provide an extension on the discussion connecting teachers’ personal lives with their professional and pedagogical practice.

Professionalism, pedagogy and the personal

Wells (2018) offers a triad of the personal, pedagogical and political as an analytic tool to explore the experiences of three gender diverse teachers who transitioned across three decades in Canada to provide informed strategies for future gender non-conforming or genderqueer teachers who might also need to navigate similar obstacles. I adapt Wells’ triadic tool to make connections among the teacher as professional, person and pedagogue. The teacher as professional requires a carving out to accommodate the person

who is the teacher, inclusive of their gender and sexuality; the pedagogue holds potential to integrate the personal, private lives and being through their work as a professional. Much of the scholarship on trans pedagogies (Platero and Drager, 2015; Keenan, 2021) also makes this claim that the presence of the trans teacher in the classroom informs their pedagogical work as trans-infused in a way that might be avoided for queer teachers, especially if they are not out at work. Jackson's (2007) work on the lives of gay and lesbian teachers in the US also provides a framework for thinking about the becoming of a teacher as both separate from and intertwined with the coming out of the closet as a queer person. Indeed, Jackson's framework leads to the integration of the professional teacher as gay, or, the becoming of a gay teacher.

To unpack the triad of the teacher as professional, person, and pedagogue is to start with how professionalism is understood and practiced. Provincial or state education legislation does little to define professionalism except to mandate it through teacher conduct, disposition, and practice. The teacher in K-12 schools is a professional, even a caring parent (as per *in loco parentis*), but one whose personal beliefs and values must not conflict with the public's construction of and investment in the professional teacher. In the Ontario, Canada context, legal precedents such as that deriving from the case of Paul Fromm warn teachers of off-duty conduct that can risk their professional status leading not only to job loss but also professional sanctions (Dickinson, 2003). As a classroom teacher in the Peel region, Fromm refused to halt his engagement in racist and white supremacist extra-curricular activities, which lead to the termination of his employment and teaching certificate. The case set a legal precedent given the curricular and pedagogical work of Fromm was not in question, but, rather, his duty to inculcate by precept and example was violated resulting in a poisoned classroom environment (Dickinson, 2003, p. 7). Indeed, professionalization, in many ways, equates to the becoming of a professional subject where personal ontologies are bracketed in favor of the dominant neoliberal teacher subject, one who is either asexual (Ferfolja, 2014) or heterosexual, marriageable, preferably feminine, and motherly (Khayatt, 1992).

Given the emphasis in the teaching profession on professionalization itself, it may seem counterintuitive to investigate something so anti-professional/personal in teachers' lives such as their gender or sexual identity. But, when a teacher's professional identity is formed through a strategic bracketing of one's sexual and gendered identity, the inequity lies in the disparity between gender and sexual diverse teachers versus cis-heterosexual identifying teachers. For the latter, no bracketing of sexual or gender identity is necessary in a system that privileges cis-heteronormativity. As Harris and Jones (2014) put it, "in school contexts, heteronormative personal details are not intimate, but queer ones are" (p. 23). For GSD teachers, identity management techniques may be a matter of survival (Keenan, 2021; Ullman, 2020; Wells, 2018), if not employability and, ultimately, self-determination.

What counts as teacher professionalism requires a rethinking given the ontological and material harm (Gray and Harris, 2014) that GSD teachers undergo in schools. Professionalism does not equate to a complete disavowal of the personal, but a reproduction of certain normative gender and sexuality persons, or subjectivities, and, thus, for GSD teachers, results in an erasure of self in an attempt to appear and be professional enough (Jackson, 2007; Wells, 2018). The limits to professional subjectivity must be expanded to account for gender and sexuality subjectivities. Currently the discursive construction of the professional teacher accounts for some subjectivity through the professional obligation to enact one's own professional judgment, or discretion. Subjectivity informs discretionary skills, combined, of course, with critically informed education and professional experience. Teaching itself is very much a discretionary, dialogic process, specifically if one subscribes to anti-oppressive pedagogies (Kumashiro, 2000). But the degree to which the person behind those discretionary skills is allowed to be presented as a person, whose humanity in its fullness is considered appropriate is very much governed by regimes of gender, race, class, and so forth. The normalized body who is classed, raced, sexed and gendered and so on in normative and dominant ways has fewer obstacles to being seen as a person because their embodiment does not conflict with the ways that the schooling system is also classed, raced, sexed and gendered along normative lines.

Certainly, what makes a professional teacher has long occupied scholars' attention. In his review of the debate between two educational theorists in the 1980s, Pitman (2012) highlights the tensions between Shulman's concern to standardize and emphasize the instrumentalization of teaching, versus Sockett's endorsement of the moral disposition and discretion of the teacher via phronesis. Updating the debate, the OECD advocates for the standardization of the profession, and the professionalization of the educator, not only to bolster public confidence in the teaching profession but also "as important public policy" (p. 11). On the other hand, Biesta (2015) is wary how neoliberal systems of management in education end up curtailing teacher discretion highlighting an urgency for protecting the subjectivity of the teacher in delivering "good" education. Wells (2018) builds on this urgency to insist that pedagogy is not fixed or technical but an embodied process that is informed by the critical disruption of cis-heteronormative gender and sexuality regimes.

Even beyond discretion or the practice of professional judgment, teachers' lives inform their practice as a professional in that they equip them with experiences, perspectives, and dispositions that make their practice alive and engaging for their students. Of course, I am referring here, in some ways, to the ideals of the profession that are articulated in the ethical and professional standards that mark teachers as pedagogues who are competent, active, and sensitive to students' well-being (see OCT). While there does exist recourse for professional misconduct, or varying degrees of disciplinary measures to regulate poor performance of teachers, some teachers may not teach in anti-oppressive ways but also not face professional sanctions. These teachers may also be technically competent but fail to challenge directly the oppressive systems that continue to harm and silence marginalized groups via race, class, sexuality, gender and so on, as well as the intersections therein. It is beyond the scope of this paper to discuss those teachers who fail to make their teaching progressive, inclusive, or dialogic (even though I do have concerns about this more broadly as well as for the implications for their students who are subsequently not engaged or themselves silenced by dominant narrative reproductions). Rather, this paper accounts for teachers whose lives would be harmed by this lack of

inclusion or acknowledgment of anti-oppressive, gender expansive, trans-informed or queering approaches to teaching given they are themselves located as gender or sexuality diverse. In actuality, the delimiting of GSD teacher agency and subjectivity leads to an equal delimiting of anti-oppressive, queer and trans-informed pedagogy.

What is most productive is to ask why or when a teacher's life is relevant to the work of schools and how it intersects with professional practice through critical engagement of curriculum and pedagogy through anti-oppressive approaches that are gender expansive, trans-informed and queering. For a moment, I turn to a remarkable example from not education, but another helping profession, psychiatry, that bridged the personal and the professional. In 1972, Dr. Harry Anonymous (now known to be Dr. Harry Tiebout) presented his account of being a "homosexual" psychiatrist and the injustices he and his colleagues had to face by literally masking himself, wearing a disguise of an unruly wig, oversized tuxedo, and a rubber mask of Nixon to make literal the masquerade of a working gay professional practitioner (Eugenios, 2022). His speech lasted a mere 10 minutes but was attributed to the eradication the following year of the removal of gay or queer as a pathological state from the DSM. In some ways, presenting himself as a ridiculous, disheveled yet articulate figure, even a figure of pathologization, he de-pathologized gay psychiatrists, decoupled their sexuality and sexual lives from the diagnosis of deviance. The life of the practitioner is most at risk when it is institutionally silenced and negated; an examination into the lives of teachers who identify as trans, queer, or gender and/or sexual diverse is to make their professional lives, and their capacity as professionals, better.

To review scholarship in teachers' work is most often an investigation into pedagogy. More personal explorations abound around attitudes, perceptions or beliefs that impact teachers' ability to support students who identify as gender diverse or queer. Much of the literature on trans or queer issues in the K-12 classroom excludes the gender or sexual identity of the teacher and focuses instead on students (Harris and Jones, 2014). But how do teachers who are trans, gender diverse or queer navigate their teaching in a climate that is historically and currently cis-heteronormative? And why is it important to think about this navigation? It is about being recognized for one's full humanity, as per Dr. Anonymous' plea: any less recognition leads to a dehumanization. Where cis-heteronormativity is written into institutional discourse, gender and sexuality diverse identities are consequently suppressed and silenced.

Key contributors have offered their own stories to describe the nuances, tensions and complexities they have experienced over the decades. This paper will review those key contributors to pay attention not only to their gains, but to also develop an appreciation for the struggles these educators have endured, all the while remaining silent or being silenced.

Sexuality-diverse teachers as persons, professionals and pedagogues

In many cases, research on the lives of teachers who are GSD are accounts offered by researchers, or, witnessed by researchers who identify also as GSD. These researchers engage in critical reflexivity by naming their situatedness to conduct ethical and anti-oppressive research. For example, Laing (2021) explains that her research on two-spirit youth who are seeking spaces for community building and political mobilization is done well only because she is able to account for herself as a whole person. Her lived experiences and identity as a queer Indigenous researcher provide her a view that enables understanding where she is aligned with her participants but also presents opportunity when she needs to learn more from them. These scholars are clear that their insights as insiders do not overwrite the stories from their participants who tell multiple, diverse, and complex tales of their own authorship. Indeed, trans and queer subjectivities and experiences are not monolithic. While they may share a common concern to disrupt cis-heteronormative colonialist structures and systems, teachers and researchers, and students who identify as GSD are also uniquely experiencing their own sexuality and gender lives.

Khayatt's (1992) book not only broke ground for articulating the presence and action of lesbian teachers in schools, whether they were out or not, she also offers personal reflection through standpoint methodology and Foucaultian analysis of regimes of power to articulate her own navigations of sexuality and professionalism. In attempt to fill the gap in existing literature, she constructed an ethnographic study of 1980s Ontario teachers who identified as lesbian (or agreed to participate in a study of lesbian teachers) in publicly funded elementary and secondary schools (p. 6). In one instance, for example, she recalls her own early career challenges of being outed unwillingly by a student:

I was caught between, on the one hand, wanting to be out, needing to claim my lesbian identity, compelled to articulate that hidden part of my experiences, and even thinking—in my innocence—that I could patch up the fragments that were my life then, and, on the other hand, having to face the terror that the label *lesbian* held for me, a teacher (p. 2).

But in these acts of hiding and protection, there are "rules" of complicity that involve not only the person who is hiding, but also the one from whom one is hiding, from whom things are hidden who have to comply with this façade and refuse to perforate its veneer (p. 3). Khayatt's methodology adapts Dorothy Smith's notion of splits or ruptures in experiences as a lesbian between ideology and felt experience "to make visible the ways in which our lives have been denied" (p. 95).

The purpose of Khayatt's (1992) book in one instance is to extract the experiences of lesbian teachers from those of gay men. It may also be as she has expressed in another introductory anecdote about her own failure or inability to confront the ideas she found perverse, specifically about how women and lesbians were being represented by the media. She explains not being able to voice her

concerns because she did not yet have the language to express herself nor the frameworks to understand on what basis were her feelings of disgust or dissent. Even when she was able to understand, as she progressed in her education as a graduate student, she found she still had very little sway or influence to enact change, specifically as a teacher (p. 3). Her book is about the persistence of lesbian teachers feeling they must be silent, that they have been silenced, even if and as they choose to be self-protective (p. 5). She provides a historical overview to explain from where this self-subscribed silencing derives both individually and socially. The nexus of gender and sexuality in lesbian teachers marks the problem not that these teachers are themselves deviant, but that the social structures upon which sexuality and gender is regulated as well as the "rejection of patriarchal prescriptions (which would keep them and other women under male control)" (p. 7) is what is deviant, in Khayatt's estimation. That is, Khayatt situates lesbian oppression, denial, silencing "within the [broader] framework of women's oppression" (p. 7) rather than homophobia. Indeed, lesbian teachers' sexuality is doubly regulated by way of patriarchal heteronormativity as well as patriarchal notions of professionalism. That Khayatt even has to refute the deviance claim highlights the era in which this study was constructed as well as the remarkable gains the field of feminism and lesbian studies has contributed to academia. Not that deviance is no longer of concern, and not that feminism itself can account for gender expansiveness or trans-informed ontologies and education, but that the lesbian teacher is not explicitly disrupting a claim of deviance. Rather, homophobia and heteronormativity operate to conceal their effects that render the lesbian teacher excluded, if not deviant.

Helpfully, Khayatt (1992) reviews the history of teachers in Ontario to situate how professionalism became entwined with the cis-heteronormative model of the male teacher or administrator with authority paired with a female teacher denoting a nurturing, marriageable and motherly caregiver, especially in elementary grades—a trope that exists currently to inform "institutional heterosexuality" (p. 61). To chart the emergence of lesbian teachers is to start with the history of women teachers. Teachers were predominantly women because of their affordability as workers versus men who were often relegated to higher-paying positions in administration given the expectation they would head families as breadwinners. Ironically, women's unions were the first to form and professionalize teaching and yet, these same women were relegated to the "worst working conditions" (p. 50) of anyone in the profession; their very inferiority propped up the professional esteem of their male counterparts. The construct of women as natural nurturers became a societal justification for their rightful place as educators, albeit underpaid and enduring employment precarity. Their capacity as heterosexual became central to socio-economic organization dependent on a certain division of labor along gendered lines. The presence of the lesbian teacher disrupts said construction as one who refused participation in the hegemonic heterosexual matrix of society (p. 5). Furthermore, Khayatt's study focuses on K-12 teachers because their legal mandate to care for children via *in loco parentis* combined with their claimed lesbian status disrupts the affirmed teacher-as-carer position. Ultimately again, the historical basis for condemnation of lesbianism derives from a heterosexual framing of women as the center of family and whose existence is tied to their capacity as procreators. In another article about strategic gender essentialism, Petersen (2000) describes this historical demarcation of gender along dualisms that are hierarchized: women are valued according to the degree they are marriageable and fertile, men are valued as persons unto themselves. Transgressions to the gender (and sexuality) order were seen to be acts against nature rendering these "rules" as universal (p. 23).

Further, in this denigration of lesbianism, women's sexual pleasure is either denied entirely or pathologized if perceived to be a threat to male sexuality (p. 17). To frame the then contemporary context of lesbian teachers in Ontario in the 1980 and early 1990s, Khayatt (1992) provides a comprehensive overview of a long history of the abjection of female sexuality and female homosexuality. Beginning with the classical interpretation of sex acts among men, Khayatt addresses the biblical regulation of sex for the purposes of procreation, highlights historical records moving to the sexologists whose work focused primarily on male homosexuality and leading to women's rights movements in the early and into the mid- 20th century where the lesbian presents as a threat only when she is able to exist on her own without a male mate.

Thus, the lesbian teachers in Khayatt's (1992) study navigated these spaces of deviance and perceived failure at heterosexual womanhood. It is key that in this history, Khayatt charts not only the construction of lesbians, but also the emergence of lesbian as an identity, something her participants grappled with or accepted partially given their own upbringing in homophobic contexts that conceptualized lesbian or same-sex female relations as moral ineptitude or abnormal mental condition. She explains both this reticence to fully identify as lesbian as well as their complicity in institutional heterosexuality through Gramscian analytics of ideology and hegemony that frame heterosexual privilege through institutional bodies of knowledge that reproduce patriarchy as neutral (p. 67). The teachers in Khayatt's study whose identities she protected with vigilance understood their existence as defying the state order of cis-heteronormativity and whose very survival depended on silence and an "invisibility [that] is historically rooted" (p. 74). They internalized shame, stigma, and engaged in actions to pass, to pursue legitimate behaviors fitting a professional teacher as a form of deliberate closeting (p. 79).

Detailing rich, diverse negotiations of understanding their sexual experiences and navigating professional teaching as a lesbian-identified or same-sex preference teacher, Khayatt's (1992) 18 participants ranged from small town to larger urban centers across Ontario teaching in multiple subject areas at varying points of their careers. Her challenges in recruiting participants were overcome only by stealth, word of mouth, trust and insider insights. Remarkably, Khayatt reworked the research process to ensure privacy of her participants from removing names from transcripts lest they be court subpoenaed to altogether avoiding pseudonym usage, thus strategically concealing their identities as they had learned to do for themselves. Khayatt presents their experiences not as representative but as an entry point to present how lesbian teachers begin to locate oneself through coping practices at school. Khayatt's participants conveyed their personal tales of coming out, remaining closeted, and every state in between through their negotiations of school spaces and interactions with school staff and students; what they did not develop was a pedagogy informed by their lesbian status.

Similar to [Khayatt \(1992\)](#), [Jackson's \(2007\)](#) work is also informed in part by standpoint theory providing some insights as a lesbian former teacher who experienced institutionalized homophobia resulting in self-silencing and denial of agency. Interviewing nine lesbian and gay teachers in an American context and collecting various curricular and pedagogical material, Jackson's work, *Unmasking Identities*, references both strategic closeting for queer teachers as well as growing rates of disclosure of sexuality despite their fears (p. 1) and the risks at coming out for the purposes of creating "a safe space for students to explore their own identities and assumptions" (p. 5). Deliberately making the connection between teachers' lives and their professional work, Jackson disrupts the de-sexed, heterosexual context of teaching to insist all teaching should sexuality affirming. [Jackson's \(2007\)](#) participants tell counter stories as professional teachers who are gay or lesbian or bisexual and who contend with barriers to becoming a complete self. These testimonios illustrate the complexity of coming out as gay, arriving at understandings of teacher identity, and consolidating queer (or gay) and teacher identity.

[Jackson \(2007\)](#) presents three broad stages of gay teacher identity formation: pre-teaching (which involves coming into gayness); closeted teaching (which involves teachers on the verge of coming out as well as those who refrain from disclosure); and post-coming out (which involves the gay poster child phase as well as the authentic phase). In the pre-teaching phase, participants' testimonios relayed a "pattern of realization, disavowal and acceptance" (p. 50) where gayness and a pursuit of teaching as an occupation align or follow similar evolutions in discoveries of self. The closeted teaching phase marked each participant's entry into teaching in that they often were confronted with the notion of the professional teacher as compulsorily heterosexual and shared a desire to secure and retain employment despite their gayness. This resulted in a bracketing of their full humanity and a fragmentation of self. This phase also re-incited trauma for those teachers who recalled their experiences in schools as gender or sexuality non-conforming students (see also [Keenan, 2017](#)).

In the latter two phases, closeted and post-coming out teaching, [Jackson's \(2007\)](#) participants remarked on fluid cycling between as well as potential for regression. The participants engaged in compensatory practices as a super teacher while still closeted, which included over-commitment to extra-curriculars and taking a protective stance to appear "beyond reproach" (p. 62). This phase expired only when the "constant vigilance about monitoring appearance" (p. 62) and self-editing to prevent "gayness from seeping into teaching" (p. 62) led to exhaustion and burnout. The post-coming out phase allowed for an integration of gayness with professional identity to merge the personal with the professional as a way to inform the pedagogical. Only at this stage did participants claim how their teaching, classroom interactions, and curriculum not only became more deliberately queer, but also could be considered good teaching due to the participation of their full humanity.

Jackson's framework is helpful if not formulaic. While allowing for regression and nuance, Jackson's framework attempts to fix, if not standardize, experiences of teachers who navigate their gay and lesbian identities alongside or despite their professional teacher identities. Responding to accusations of representing gay identity formation projects as too simplistic or reductionist (p. 79), Jackson intends instead to capture nuance and make clear the connection that the gay self is part of the teacher self through integrated authentic teaching. Her intent is to provide a starting point for interrogating institutionalized homophobia and heterosexism through the recognition of diverse sexuality teachers as professionals.

While [Jackson's \(2007\)](#) data is almost two decades more recent than [Khayatt's \(1992\)](#), both articulated the distinction of the label of gay or lesbian versus the experiences of being in same-sex relations or intimacies. Not all of Khayatt's participants were comfortable claiming the lesbian label; indeed, multiple and contested understandings of the label exist and for some it did not feel suitable. Arriving at a self-claimed identity label of both lesbian/gay and teacher is the process of becoming that [Jackson \(2007\)](#) is interested in charting, and what [Wells \(2018\)](#) calls a political act, for whom trans teachers have little room to thwart given their embodied difference when in the midst of transitioning in schools and as professionals. For queer teachers who are ready to claim gay or lesbian identity, queering may not be secured but at threat, "fleeting, contingent, and just as rapidly revoked" by state powers that legalize homophobia ([Gray and Harris, 2014](#), p. 9) or fail to ensure inclusive, comfortable climates for queer professionals ([Jackson, 2007](#)).

Gender-diverse teachers as persons, professionals and pedagogues

The connection among the teacher as person, professional and pedagogue rearticulates with an emphasis on trans-infused pedagogies for trans and gender-diverse teachers. The requisite embodiment of gender diversity, especially for trans teachers who fail to or do not pass as gender conforming distinguishes their potential from queer teachers, something [Keenan \(2021\)](#) calls a gift to students who need to see gender diversity in their teachers whom they trust and respect as good teachers. Describing his own teaching practice as both trans-informed and decolonizing, Muñoz positions his teaching as the political act of embodying space in the classroom as teacher who is both a person of color and genderqueer ([Muñoz and Garrison, 2008](#)). In his account, teaching is inseparable from the body and life of the teacher. Indeed, the roundtable discussion that is the basis of his article concludes by insisting the questions around trans and queer bodies as teachers in classrooms require an interrogation into mis-readings as well as the possibilities that might emerge for their continual engaged presence.

Situated as a suitable middle ground between sexuality and gender diverse teachers, [McCarthy's \(2003\)](#) article features one transgender teacher's experiences that emerged through coming out as lesbian and moving toward feeling more transgender despite remaining closeted at school for many years. What is most significant is the way that Kelly navigated schooling, initially grappling with coming out as a lesbian when they identified as female, deliberately wearing more feminine clothing as compensatory practice to avoid speculation over their sexuality and feeling isolated socially from their colleagues. In these early years, Kelly also refrained

from disclosing their sexuality to their students, but not without trepidation and difficulty: "I would tremble when a kid would call me a dyke and it would be because they were trying to insult me, not because they had any idea that I was really gay. That used to really scare me" (p. 173).

As Kelly's professional status became more secure, so too did their exploration of their gender expression; Kelly began wearing more male clothing and eventually came out at school to many colleagues as lesbian, but kept their emerging trans identity hidden. Kelly explains that much heterosexual discomfort around gay and lesbian people come from fears that gender lines are crossed; if cisgender status can be confirmed, the threat is removed. For Kelly, the discomfort from colleagues could not be assuaged because Kelly did not have a female identity. The questions around gender identity were valid: "it's more threatening because their judgments, their discomfort, their ignorance, and the ideas they have within that ignorance are somewhat true, in my case ... I am wearing my identity. I literally wear clothing to project a certain look that matches my gender identity" (p. 174).

While Kelly expresses an emerging trans identity, they still resort to calling their gender expression "gay," and calling themselves a woman, which coincides with McCarthy's (2003) explanation that Kelly is limited by available language. What is more concerning perhaps is that McCarthy frames transgender itself in limiting terms where it stands only to challenge the gender binary, and must be consequently limited therein (p. 180). This article is relatively new in the field of trans studies; however, its construction of trans as defying the gender binary ignores those trans folks who embrace the gender binary, gender norms, and identify not as their assigned sex but their own claimed gender identity.

Setting these concerns aside, if possible, this chapter is about illustrating varying ways GSD teachers navigate their personal lives where relevant in the classroom. For Kelly (McCarthy, 2003), meeting new students and staff who confronted them about their gender diverse appearance meant a new struggle, one that exhausted Kelly even though they responded that they hoped to develop a relationship with their students where questions like that might be better addressed: "And once I get to know the kids, ... they respect me and they know that I care about them. And it doesn't matter what I'm wearing; they don't care anymore. ... And having a teacher who creates an environment that is comfortable and enjoyable and relaxed and stimulating, in terms of learning, they so quickly forget how I'm dressed and how I look" (McCarthy, 2003, p. 174). However, this navigating takes its toll: "But it's lonely, it's lonely to feel like I do, and know that there's definitely not any place for that in the work environment. And I don't even get sad about it; it's just the reality" (p. 174). Kelly also described a vivid scene where a group of students violated her car with urine, saliva and food in retaliation for being suspended for an earlier misdemeanor. To add to the distress, the vandalism was ignored: both the administration at the school and the police advised Kelly not to press charges to avoid further and more severe retaliation.

McCarthy's (2003) article is notable for the uninterrupted passages of Kelly's experiences navigating interactions with students who are both challenging (and even violent) and also accepting. Ultimately, however, the school environment did little to support Kelly in their own trans becoming, similar to the experiences of Ullman's (2020) trans participants. Kelly's support system at home, their built-up confidence in delivering professional development workshops, and their overall love of the job provided protective barriers to the systemic and normalized homophobia, transphobia and cisgenderism in their workplace. In looking to the future, Kelly expressed required education for all teachers to learn not just about gender discrimination, but also disrupting harmful gender norms.

Not all trans or gender diverse lives may be represented fairly or fully in scholarship. Mere inclusion of trans stories does not guarantee the interpretive material will be critically informed or trans affirmative. Gender diverse and trans voices must be included with care, under-interpreted, and left to speak for themselves, or, better still, interpreted by themselves as is the case for trans researchers who also relay their testimonios as trans teachers (see Muñoz and Garrison, 2008; Keenan, 2017, 2021). Where McCarthy's (2003) paper is situated in an equity lens, it fails to account for the gendered nuance of the participant even despite the extent to which it presents the words unfiltered from the trans participant. It seems that through an attempt to analyze Kelly's ideas, McCarthy re-establishes cisnormativity and biological determinism by calling Kelly by female pronouns despite their repeated expression of their identity as trans and masculine.

In long, uninterrupted excerpts presented as counter stories, Wells' (2018) article retains the authenticity of the participants' ideas but also frames them through their pedagogical and political potential to inform gender affirming education. Refusing to rewrite their tales, Wells' concern is instead to highlight their contributions as trans teachers who have historically been denied their full humanity, struggled to be known and constructed as monstrous, if not erased entirely. Their testimonios are also an active resistance to "(re)make and (re)define their personal and professional identities" (p. 1545), to rewrite their own intelligibilities in light of the ongoing regulation of cisnormative gender regimes in schools. Scaffolding the experiences of three trans MTF (male to female) teachers who transitioned in the 1980s, 1990s, and 2000s in Canada, Wells provides the triadic model as introduced above through the personal, pedagogical and political. Conversely to Khayatt's (1992) discreet methods to protect the identities of her participants, Wells' (2018) participants refused erasure insisting on the publication of their real names despite the ongoing risk, threat, and potential trauma that anonymity might protect against. In this act of self-writing, they enact their roles as "resilient survivors and pioneers in education who have transgressed a culturally ingrained pedagogy of impossibility in order to transform bodies, identities, and minds" (p. 1546).

Like Jackson's (2007) deliberate unmasking, these trans teachers refuse "to carry the stigma of silence, invisibility, shame and denial" (Wells, 2018, p. 1551) and instead wish to pursue both "a desire for recognition, ...[and] a quest for personhood" (p. 1551). Gayle, Angela and Carol relayed stories of rupture where students recognized their gender identity in glimpses, where fears around job loss and professional sanctions especially post-transition remained, and where the pain of living not as their authentic gendered selves caused too much pain to bear. They transitioned in different contexts: one where legal protections saved Carol's job as a teacher, if only technically; one where medicalization justified Gayle's transition to colleagues and employers; and one where

school health supports eased Angela's transition at school, even though she still experienced intolerance and cisnormative resistance. All experienced "uncertainty, hyperawareness and fear" (p. 1555) and had to confront the "threat of misrecognition and the specter of the monstrous" (p. 1557) when colleagues, administrators or parents expressed mistrust post-transition. Most productively, these testimonios share also trans-infused curriculum and pedagogy where pedagogy is understood to be "a continual state of being ... [and] an emergent process" and for whom trans "bodies become the site for an engagement with a pedagogy of (im)possibility in which gender is cast from its binary moorings and the conditions for existence are transformed" (p. 1562). These trans teachers infused trans embodied pedagogy through their classroom management, interactions with students and curricular content.

Keenan (2017) writes his own perspective on trans-infused curriculum through his lived experiences as a trans teacher in elementary education. Keenan embraces the complex and "limitless possibilities of bodily expression" (p. 539) in trans folks denying universality except in the common ways that trans, gender diverse, or queer people "challenge dominant paradigms of identity categorization" (p. 539). He is also careful to insist that he speaks only for himself and not for the community of queer and trans people. It is this balance between complexity of gender identities and common ground that makes Keenan's self-expression meaningful to the purpose of developing critical trans pedagogies. Again, these pedagogies derive from the lived experiences of the trans educators who practice them. They cannot be separated out from the lives of trans folks.

Keenan (2017) also writes his own narrative, similar to Kelly's from McCarthy's (2003) article except that Kelly was responding to interview questions and Keenan (2017) is both participant and researcher. He presents early memories of dressing and styling his hair as masculine; he also encountered challenges to this expression when he entered school: "my way of expressing myself challenged a system that just didn't make a whole lot of sense to me" (p. 541), similar to Kelly whose gender expression as a transitioning teacher confronted cis-hetero gender norms followed by many of their colleagues. Keenan's (2017) stories are presented as learning moments of "embodied knowledge" (p. 542) informing his teaching. Indeed, much of Keenan's life as a student in K-12 schooling he explains taught him "to hate my genderqueerness ... to hate myself" (p. 542). Thus, his teaching as an adult of K-12 students is an active pursuit in breaking those scripts of cis-heteronormativity to break the effects of self-hatred, transphobia, and cisgenderism for young people. To be a trans educator in schools whose pedagogy is deliberately informed by one's own life as a trans person is also, for Keenan, to return to "the site of much of [their] own trauma" (p. 544).

How Keenan (2017) understands, expresses and is read as gendered, raced, and classed also implicates his professional practice. For one, he acknowledges his white and male privilege delivers status and readability, but may conceal his trans-ness, and present a potential barrier for students who are looking to teachers for support and understanding in their own gender explorations. Unscripting gender acknowledges that gender is complex and "always limited by the social and geographic location of our bodies in the world and the history of how we came to be where we are" (p. 547). It is not easily scripted, defined, fixed, neither is it biologically determined. Instead of ignoring the gendered realities of trans and queer teachers, Keenan insists "we need pedagogies that concentrate more of our efforts on inviting people to be with each other in our full humanity" (p. 553).

Answering the call to infuse trans pedagogies through education is the meta presentation of trans pedagogy in action, a dialog between Platero and Drager (2015) acting as both model and content of trans pedagogical practice. These trans educators account for where teachers' lives intersect to inform pedagogy and to provide a queer future that relies on coalition, consensus, critical and constant practice of trans pedagogies. Their accounts interweave the personal with the professional and pedagogical work of teachers, especially as they "embody an interruption to the norm" (p. 450). They live and work in Spain and contest with political, colonial, economic and linguistic limitations to their teaching as trans and via trans pedagogies. They also explain that the pedagogy of discomfort (Boler and Zembylas, 2003) means an active embrace of the uncomfortable, those sorts of questions students and children ask as curious learners, in order to disarm the unknown and to continue to foster critical understanding of gender diversity and possibilities. As trans educators, their embodied presence in the classroom may be enough to start trans-infused pedagogies, but they also must actively work to claim their intelligibility, otherwise, "gender becomes something to be ignored, rather than discussed" (Platero and Drager, 2015, p. 453). Their hypervisibility as trans teachers risks a strategic invisibility lest they actively disrupt cis-heteronormativity.

In an occasional paper series, Keenan (2021) takes his critical trans pedagogies to the next level to write in no uncertain terms a survival guide for trans educators. Entitled, "Keep Yourself Alive: Welcoming the Next Generation of Queer and Trans Educators," Keenan relays a history of trans rights interwoven with his own history of gendered and trans subjectivity. Similar to Khayatt's (1992) history of lesbian teachers, albeit shorter, both provide a context and legacy for the work they contribute to their fields. Keenan (2021) acknowledges his own teaching capacity as a former teacher and current professor who is also trans is built on the backs of forebearers in trans studies and activism; to carry the possibilities of trans-infused pedagogies further is to own one's responsibility in this pursuit.

Conclusion

Teachers who are gender or sexuality-diverse are people whose lives are curtailed, delimited, misrecognized and erased, or rendered monstrous if seen at all, but they are also professionals who not only teach students but must prepare them to live in a world that will continue to harm unless active disruption to cis-heteronormative, racist, colonialist practices are part of their pedagogy. Teachers' lives always inform their pedagogy by virtue of their ability to live as full and authentic human beings; for GSD teachers, this actualization continues to be at risk.

Teachers who are trans, queer, non-binary, genderqueer, and so on may serve as role models, but better still, represent a diversity of gender and sexuality to students that is possible to claim. GSD teachers navigate a fraught landscape of teaching to celebrate the gains, successes and disruptions of cis-heteronormalization. This paper has reviewed queer and trans teachers through their lives as presented in academic research.

While GSD teachers' lives are already oriented to doing anti-oppressive work, this remains not the burden of GSD teachers alone. Rather, being a professional begins with a legal and professional obligation to uphold the ethical and professional standards of the teaching profession, regardless of their own personal ideologies, belief systems, or lived experiences. Certainly, to have one's personal belief system align with professional standards is an easier journey, but to do critical anti-oppressive gender expansive and queering work, attention must be paid to the disposition of all teachers as well as the work that teacher does to shift their own understanding toward critical trans and queer informed pedagogy and curriculum. To articulate a framework for engaging with teacher beliefs is that of the pedagogy of discomfort from Boler and Zembylas (2003) wherein a teacher must "identify unconscious privileges as well as invisible ways in which one complies with dominant ideology" (p. 111). Only through this practice of critical discomfort is one able to apply critical frameworks informed by trans affirmation and queering to their teaching. The role of the pedagogy of discomfort is less about the discomfort of teachers whose lives have been systemically oppressed due to their sexual and gender diversity and more about how other teachers who have been in the service of the dominant ideologies around gender and sexuality must work to disrupt that service and attachment thereby experiencing discomfort. The lives of teachers are affected not only if they are minoritized; indeed, for gender expansive education and policy in schools to be successful, all teachers must take close study of their own lives to see how they are positioned as oppressors in order to undo that harmful practice.

The implications for students also remain because if teachers whose gender identity or sexuality is unsanctioned in schools come to work as incomplete, fearful, and constantly guarded, the effect for their students who might also feel the same is only reproduced or exaggerated. For others, the climate of intolerance, hate and cis-heteronormativity remains uninterrogated and stable. Students who identify, or are coming to do so, as GSD are equally fearful, guarded or feeling incomplete in schools where teachers and pedagogy are cis-heteronormative. Claiming that GSD teachers are not able to contribute their full professional selves in cis-heteronormative schools is not to be misinterpreted as an association between performance competence and teacher identity because that can lead to dangerous ground. This slippage would alight on conclusions that would only be homophobic, racist, transphobic, ableist and so on. Thus, it is important to insist that it is not teacher performance that is at risk if teachers are otherwise engaged in self-protective strategies due to their gender or sexual diversity. Rather, the health, authenticity and self-actualization of GSD teachers, students, and the entire school climate is at risk when GSD teachers feel their lives are inappropriate, pathological, deviant or monstrous. In the words of Platero and Drager (2015), critical trans (and queering) pedagogies require no "end point to this process of imagining and striving ... and pushing for a future and/or different world" (p. 459) that fails to reproduce shame, harm, and moves toward gender and sexuality affirmation, integration, and authenticity.

Acknowledgment

The author wishes to acknowledge the kind and ongoing academic and personal support of Dr. Wayne Martino in the conceptualization of this paper as a focus on trans and queer teachers' lives.

Introduction

The [European Commission \(2021\)](#) has highlighted the presence of motivated teachers as a crucial prerequisite of any successful education system wherein students, regardless of their socioeconomic backgrounds, are able to be successful in their educational endeavors. However, the teaching profession has been enduring a longstanding vocational crisis, illustrated by high levels of teacher turnover and attrition ([European Commission, 2021](#)). A recent study by [Federičová \(2021\)](#) examining the occupational trajectories of teachers in nineteen European countries estimated the rate of teacher turnover to be around 28% and found that the rates of turnover varied across the continent, ranging from 15% to 37%. Previous studies have shown how high rates of turnover and attrition has a disruptive impact on schools as it diminishes the social cohesion and quality of tuition provided at schools ([Carver-Thomas and Darling-Hammond, 2019](#); [Kelchtermans, 2017](#); [Ronfeldt et al., 2013](#)). A report by the [OECD, 2016a](#) corroborated the disruptive impact of teacher turnover and estimated that one of ten students in Europe attended a school with teacher shortages. In addition to this, several studies have also suggested that high rates of teacher turnover reduce the level of educational equity as lower performing schools and schools serving students from socio-economically disadvantaged backgrounds are disproportionately affected by turnover ([Johnson et al., 2011](#); [Ronfeldt et al., 2013](#)). As such, the vocational crisis in the teaching profession poses a significant challenge for education systems in Europe.

The research literature has pointed to teachers' dissatisfaction with their working environment and the diminishing status of the teaching profession as being salient factors influencing teachers' retention outcomes (Nguyen et al., 2019; Nguyen, 2021; Viac and Fraser, 2020). This has in turn directed the attention toward policy measures aimed at improving the attractiveness of the teaching profession in order to facilitate teacher recruitment and retention (European Commission, 2013; See et al., 2020). Consequently, teachers' perceptions about the teaching profession and their well-being at work has risen to the top of European and national policy agendas and teachers working conditions has been identified as an important element to improve in order to enhance the attractiveness and status of the profession (European Commission, 2021; Viac and Fraser, 2020). Job satisfaction has been highlighted as a "*decisive element*" involving positive or negative appraisals that influences teachers' attitudes and performance at work (Caprara et al., 2003, p. 823). Teacher job satisfaction is a conceptualization of teachers' affective responses to their teaching role and can be defined as "a state of mind determined by the extent to which the individual perceives her/his job-related needs to be met" (Evans, 1997, p. 328). Teacher job satisfaction also involves teachers' perceptions of job comfort and job fulfillment; two key components which capture how satisfied an individual is with their job conditions and circumstances, and the extent of their satisfaction derived from personal accomplishments within meaning areas of their teaching role (Evans, 1997). The importance of teacher job satisfaction has been emphasized in the research literature and it has been found to be associated with favorable working environments (Toropova et al., 2021; Wang et al., 2020), better occupational health outcomes (De Simone et al., 2016; Skaalvik and Skaalvik, 2009, 2011a, 2017b, 2020), teacher wellbeing (Shoshani and Eldor, 2016), higher levels of self-efficacy (Burić and Kim, 2021; Gil-Flores, 2017; Skaalvik and Skaalvik, 2014), better student outcomes (Collie et al., 2012), and crucially a willingness to remain in the profession (Björk et al., 2019; Madigan and Kim, 2021; McCarthy et al., 2014; Skaalvik and Skaalvik, 2017a,b).

Empirical evidence derived from large scale studies such as the Teaching and Learning International Survey (TALIS) conducted by the Organization for Economic Co-operation and Development (hereafter OECD) have amplified the voices of school leaders and teachers by placing their views at the forefront of educational policy analysis and development (OECD, 2019c). Results from TALIS surveys have influenced educational policy across the world and has driven the interest in comparative research comparing key indicators of effective teachers and teaching, such as teachers' job satisfaction, cross-nationally (OECD, 2020a). A recent study by Zakariya et al. (2020) ranked 38 countries in relation to the levels of teacher job satisfaction on the basis of TALIS 2018 data. In light of these results, the current study aims to investigate the relative importance of school working conditions for teachers' job satisfaction by comparing data from countries representing the highest (Austria) and lowest mean (Malta), as well as countries situated in the lower, middle, and upper parts of the distribution: Sweden (28), Estonia (19) and Slovenia (9). By doing so, this study aims to contribute to the literature by providing insights into which factors in the school work environment stand out in the countries with higher versus lower levels of teacher job satisfaction.

Background

This section provides an overview of the conceptualization of teacher job satisfaction and discusses how teachers' appraisals of their teaching conditions influences their job satisfaction. Following this, an overview of the education systems in the countries of interest to this study is provided.

Teacher job satisfaction

Teachers' satisfaction with their working environment and occupational role is influenced by numerous factors and can be assessed in different ways. The literature has conceptualized and studied teacher job satisfaction as both a facet-specific measure of teachers' satisfaction with aspects of their job and as an overall measure of teachers' satisfaction with their teaching role and conditions (Skaalvik and Skaalvik, 2009, 2011b). Most studies have however favored measuring teacher job satisfaction as an overall sense of satisfaction as facet-specific measures of job satisfaction are susceptible to individual differences and are dependent on the value placed on specific aspects of the job by the individual teacher (Skaalvik and Skaalvik, 2009, 2011b). Indeed, despite teachers' job satisfaction being the result of the combination of factors across levels, empirical evidence has consistently shown an association between school-based factors and teachers job satisfaction (Gil-Flores, 2017; Lopes and Oliveira, 2020; Sun and Xia, 2018).

The job-demands resource model

The job-demands-resource model (JDR) is a theoretical framework that has commonly been used to examine how teachers' perception about their teaching role and their well-being at work influences a range of organizational outcomes (Bakker and Demerouti, 2017; Dicke et al., 2018; Granziera et al., 2020). The model, which enables the investigation of how job characteristics influences occupational well-being and job performance, suggests that working conditions can be classified as either job demands which refer to "physical, social, or organizational aspects of the job that require sustained physical or mental effort and are therefore associated with certain physiological and psychological costs" or job resources which refer to "physical, psychological, social, or organizational aspects of the job that may [...] be functional in achieving work goals, reduce job demands and its related costs, or stimulate personal growth and development" (Demerouti et al., 2001, p. 501). Applied to a teaching context, job demands would encompass

factors such as quantitative workload, role conflict, time pressure and challenging student behavior (Hakanen et al., 2006), whereas job resources involves factors such as autonomy, social support from colleagues and school leadership and other factors that can facilitate occupational goals and professional development (Granziera et al., 2020).

The model suggests potential interactions between job demands and job resources in which the presence of a job resource can mitigate job demands and facilitate occupational well-being, motivation, and better health outcomes (Bakker et al., 2007; Bakker and Demerouti, 2017). For instance, Bakker et al. (2007) examined the interactions between job demands (student misbehavior) and job resources (job control, supervisory support, school climate, innovativeness, and appreciation) in a sample of 805 elementary, secondary, and vocational school teachers. Their findings indicated the importance of the job resources included in the study for teachers as they all provided a buffer against the negative influence of student misbehavior on teachers work engagement.

In addition, advances in the conceptualization in the JDR model has emphasized the importance of personal resources in shaping workplace experiences. Personal resources, which refer to self-evaluation of one's ability to influence one's environment, has been found to influence the effect of job demands and job resources on organizational outcomes (Collie et al., 2011; Xanthopoulou et al., 2007). In their study, Dicke et al. (2018) examined how teachers' personal resources (self-efficacy in classroom management) moderated the relationship between job demands (classroom disturbances) and emotional exhaustion and found that self-efficacy reduced the negative association observed between classroom disturbances and emotional exhaustion while simultaneously enhancing work engagement when classroom disturbances were particularly high. Taken together, these results suggest that job resources and personal resources can safeguard teachers from the negative effects of job demands and at the same time enhance teachers' sense of satisfaction at work.

Relationship between job demands, resources and teacher job satisfaction

Studies adopting the conceptual framework provided by the JDR model have consistently provided empirical evidence illustrating the differential effects of job resources and job demands on teacher job satisfaction (Madigan and Kim, 2021). Despite teaching being a rewarding occupation, it is widely acknowledged that teaching involves a high degree of job stress (Ramberg et al., 2021). Job demands such as workload stress, characterized by a high quantitative workload and an increased focus on administrative tasks, impedes teachers' ability to rest and recover (Arvidsson et al., 2016), facilitates emotional exhaustion and burnout resulting in job dissatisfaction (Skaalvik and Skaalvik, 2020). Student discipline and classroom management problems are another source of occupational stress for teachers which inhibits their goal achievement, influences their self-efficacy beliefs, and accelerates job dissatisfaction (Collie et al., 2012; Klassen and Chiu, 2010; Skaalvik and Skaalvik, 2011a; Wang et al., 2018). Moreover, job dissatisfaction results in decreasing motivation and enthusiasm for teaching which can in turn lead to higher attrition rates for the teacher profession (Buric and Moe, 2020; Madigan and Kim, 2021).

Most teachers are successful in their coping of job demands and employ a wide array of strategies such as seeking social and emotional support from colleagues (Hong, 2012; Thomas et al., 2021) however, the inability of coping successfully with these job demands invariably results in feelings of burnout (McCarthy et al., 2009). Indeed, given the inherent social connectedness found in the educational milieu, several studies have pointed to support from colleagues and school leadership as being a particularly important job resource that buffers against workload stress and facilitates job satisfaction and retention (Pomaki et al., 2010; Thomas et al., 2019). A teaching environment characterized by support from colleagues and the school leadership is indicative of a positive school climate which also positively influences job satisfaction (Aldridge and Fraser, 2015; Lopes and Oliveira, 2020). A positive school environment is also important for boosting teachers' sense of self-efficacy, which further results in job satisfaction among teachers (Malinen and Savolainen, 2016; Skaalvik and Skaalvik, 2014). Another important job resource that has been identified by the literature is teacher autonomy and studies have shown that teachers experience higher levels of job satisfaction when they are able to exercise their autonomy and self-determination (Collie et al., 2018; Skaalvik and Skaalvik, 2014).

In accordance with JDR model and on the basis of previous research, this study investigates how various job demands and job resources in the school work environment, including a personal resource of teacher self-efficacy beliefs, are related to teacher job satisfaction. The hypothesized relationships are explored for each of the countries of interest according to the conceptual model presented in Fig. 1.

Country settings

The importance of context is critical in comparative research and is essential to deepen one's understanding of the ways by which global and national policies influence the quality of the education system in different countries. International comparative studies illustrate the uniqueness of the regional locations while simultaneously pointing out their similarities and differences (Dutt, 2017). The locational comparisons draw out the diversity of the regions, socio-economic context, cultural peculiarities and highlight the points of intersection to compare and contrast educational systems. This regional analysis not only deepens the understanding of different systems but also identifies a new basis for cross-cultural discussions (Bray and Thomas, 1995). Teaching profession is not an exception when studied cross-culturally, and the context of the education system becomes an integral part of such investigation (Steiner-Khamsi, 2014). This section provides a brief account of the education system and teacher situation in Austria, Estonia, Malta, Slovenia and Sweden.

Fig. 1 Conceptual model of job demands, job and personal resources and teacher job satisfaction.

Overview of Malta's educational system

Malta has always had a strongly centralized governance of education in which the Maltese Ministry of Education and Employment has been responsible for the administration, organization, and financial management of schools. However, recently the Maltese educational system has been undergoing an educational reform process in which the governance of education is becoming increasingly decentralized (Cutajar et al., 2013; Mifsud, 2016). Schools in Malta are divided into three categories: church schools, independent schools, and state schools. State schools are free of charge and are networked into ten regional colleges each led by a College Principal (Sultana et al., 2019).

The Maltese education system consists of compulsory schooling between the age of 5 and 16 and the first cycle of formal compulsory schooling starts from year 1 to year 6. The secondary cycle involves a 5-year program in lower secondary schools to the age of 16, followed by national examinations (Secondary Education Certificate) in curricular subjects. Malta is a bilingual country, and the instruction is held in both English and Maltese. Moreover, the Maltese educational system is mostly based on the British curriculum.

Participation in international studies and student assessments have highlighted several challenges facing the Maltese education system. In 2014 Malta's Ministry for Education and Employment released the "Framework for the Education Strategy for Malta 2014–2024" which outlined Malta's strategy for overcoming the achievement gap between students attending state schools and those in non-state schools. In addition to this, the reform also outlined Malta's strategy to deal with: the high rate of early school leavers, of which Malta ranks the highest across the European Union; inclusive education; and the introduction of the Learning Outcomes Framework (Sultana et al., 2019). The Maltese government also implemented a new reform in secondary schools in 2019 titled "My Journey: Achieving through different paths," introducing three streams offering students additional vocational and applied pathways in order to encourage student retention. Some scholars have argued that these major educational reforms have been introduced without providing adequate preparations for schools and teachers to address these changes, resulting in feelings of ambiguity among teachers regarding their role and responsibility (Cutajar et al., 2013; Mifsud, 2016).

Overview of Estonia's educational system

In contrast to Malta, the Estonian education system is highly decentralized and the division of responsibility between the state, municipalities and schools is clearly defined. The overarching educational policy and national strategy, the Estonian Education Strategy 2021–35, is set by the Estonian government and the Ministry of Education and Research who are also responsible for ensuring the provision of quality education and setting the laws and regulations for education funding and quality assessment. Municipalities own the schools in their district and are responsible for their administration, regulation, and financial management. The Estonian education system consists of compulsory basic education schooling from year 1 to year 9. Secondary education is a 3-year program divided into general secondary education, provided by upper-secondary schools, and vocational upper-secondary education, provided by vocational schools (Santiago et al., 2016).

According to OECD (2020b) reports, Estonian schools rank the highest in the OECD for autonomy with 58.3% of key decisions made by Estonian schools compared to the OECD average of around 34%. School principals in Estonian schools are also highly autonomous and are responsible for the financial management and quality assurance of the school. In 2014 the national curriculum for basic and upper secondary schools underwent a reform consolidating the central role students have in their own learning (OECD, 2020b). In addition to this, the curricular reforms also enhanced the autonomy for schools and teachers by giving them free rein over how to organize the learning process according to the school context and the student's educational needs (Erss, 2018).

Despite cutting back on education expenditure and having a below-average education expenditure in comparison to other OECD countries, Estonia has performed well in international studies and student assessments (OECD, 2020b). In addition to these reforms, Estonia has made great strides in improving inclusive education and teachers' wages, resulting in an increased proportion of teachers feeling that the teaching occupation was valued by society in TALIS 2018.

Overview of Slovenia's educational system

The governance and funding of education in Slovenia is shared by the state and the municipalities. The state sets the educational policy and is also responsible for establishing public upper-secondary schools, higher education colleges, special education institutions and student accommodation. The Slovenian Ministry of Education, Science and Sport is responsible for the evaluation and implementation of regulations, compulsory basic schooling, and upper secondary school (OECD, 2016b, 2019b). Other bodies such as the National Education Institute, the Inspectorate for Education and Sport, and the National examinations center also play a part in shaping and implementing educational policy. The most recent national curriculum (2011/12) introduced a range of key competencies to be developed in general education. The Opening up Slovenia reform was introduced in 2014 and aimed to complement the national curriculum by enabling innovative and dynamic learning approaches (OECD, 2017).

Municipalities are responsible for establishing and providing kindergarten, basic schools, and adult education institutions. School leaders are appointed by school councils and are employed for a 5-year term. Compulsory education is referred to as basic school and starts from age 6 up until 15. The majority of schools in Slovenia are public and parents are able to choose which schools to enroll their children in. Schools in Slovenia have an average level of organizational autonomy and are responsible for most schooling decisions such as the organization of instruction and resource management (OECD, 2016b).

However, in contrast to Estonia, Slovenian schools have less influence over the curriculum and student assessment. One of the main challenges facing the Slovenian education system is the need to improve teaching conditions and the quality of teaching. According to OECD (2016b) reports, the teaching conditions in Slovenia include fewer teaching hours and smaller class-sizes in comparison to other OECD countries.

Overview of Austria's educational system

In Austria, the state holds the overall responsibility for the Austrian education system. The Federal Ministry of Education are responsible for the national curriculum in compulsory education, school quality development, school legislation, and staffing matters. In addition to this the Federal Institute for Research on Education, Innovation and Development of the Austrian School System collects educational data about students, teachers and schools which is used for school evaluations and policy development. Provincial authorities are responsible for implementing educational legislation and staff provision for compulsory schools in their district. At the municipal level, local authorities are responsible for the maintenance of school buildings. Austria's school governance is fragmented and complex as responsibilities are shared between the state, provinces and municipalities and further differ according to school type and education level (OECD, 2016b).

Compulsory education in Austria comprises of 9 years in primary school and lower-secondary. Most schools are publicly funded however Austria also has several fee-paying private schools and allow home-schooling for children. School choice is limited in primary education as students are assigned to schools in their geographical catchment areas. However, school choice is allowed during secondary schooling. Austria is one of two countries within the OECD that allows academic streaming at an early age and students transition to secondary education either via a compulsory secondary school or an academic secondary school (OECD, 2016b, 2017).

One of the main challenges facing the Austrian education system is reducing the achievement and gender gaps in student achievement by promoting effective and equal opportunities for all children regardless of their cultural or socioeconomic background. Student performance has been declining across PISA cycles and reports have also shown how the influence of students' socioeconomic background on their student achievement is higher than the OECD average (OECD, 2017). This has prompted the Austrian government to invest heavily in initiatives and programmes, such as The New Secondary School and language support courses, that aim to reduce the influence of early academic streaming and enhance the provision of equitable learning outcomes for all students regardless of their background.

Teaching is highly regulated in Austria and teachers' workload, worktime, and teaching time among others are regulated in teacher service codes, which in turn differ for federal teachers and teachers at provincial schools (OECD, 2016b). According to reports by the OECD (2017), Austria has a large proportion of teachers nearing retirement-age and attracting teachers to the profession is one of the main challenges facing the Austrian education system.

Overview of Sweden's educational system

Sweden's education system is one of the most decentralized education systems in the world. Since the 1990s Sweden has undergone a long process of educational reforms and restructuring and is today one of the most decentralized education systems in the world. The state sets national objectives and student learning outcomes, consolidated in legislation and steering documents, and determines educational policy which is carried out and implemented by the municipalities (OECD, 2015, 2019a). The municipalities in Sweden are responsible for the financial management and administration of schools in their district.

The Swedish education system is a market-based education system characterized by a high degree of free school-choice. School funding is attached to students rather than to individual schools which has led to a high degree of competition between schools. Compulsory schooling in Sweden comprises of 10-year schooling and most of the schools are public schools however, there is a large proportion of independent schools which are also publicly funded. Municipalities are required to ensure that schools adhere to and follow national objectives however schools and municipalities are awarded the freedom to decide how to achieve national objectives and targets (OECD, 2019a). The quality of education provided by Swedish schools and their compliance with regulations are further assessed and evaluated by the Swedish Schools Inspectorate and the Swedish National Agency for Education.

According to the [OECD \(2019a\)](#), some of the main challenges facing the Swedish education system is the need to improve students learning environment; enhance educational equity by addressing school segregation; implement effective resource allocation processes and improve teaching conditions. In order to address these challenges, Sweden has implemented several initiatives and programmes, such as the subject-specific knowledge boost programmes, which aim to strengthen learning in school environments and improve learning outcomes. Improving teaching conditions is an important challenge facing the Swedish education system as the amount of certified teachers working in the profession has reduced over time ([Adermon and Laun, 2018](#)), and the availability and distribution of qualified teachers is one of the factors driving school segregation ([Skolverket, 2020](#)). Teachers job dissatisfaction has received a lot of attention in Sweden and several initiatives and measures, such as the First Teacher reform and the Boost for Teachers program, have been implemented to improve teaching conditions.

Even though the countries of interest to this study are all situated in Europe, they represent quite diverse geographical regions as well as different educational and cultural contexts which are important for our understanding of the factors in the school work environment that relate to teacher job satisfaction. This study aims to investigate the relationship between job demands and resources (including personal resource of self-efficacy beliefs) and teacher job satisfaction in Austria, Estonia, Malta, Slovenia and Sweden.

Method

Data sources and sample

The study is based on a secondary analysis of data from The Teaching and Learning International Survey (TALIS)—a large-scale study of school work environment and learning environments as experienced by teachers and school principals ([OECD, 2020a](#)). These groups fill in a comprehensive questionnaire on their demographic information, professional characteristics as well as their perceptions on a wide array of school work conditions, job satisfaction and perceived value of the teaching profession, among others. TALIS has been conducted since 2008 on a 5-year cycle, with the next survey scheduled for 2024. Around 260,000 teachers in 15,000 schools in 48 nations were covered by the latest 2018 assessment ([OECD, 2019c](#)). Thus, TALIS offers an opportunity to compare school work conditions in a number of education systems worldwide.

TALIS selected teacher populations in each respective country using a stratified two-stage probability design, meaning that schools were randomly selected at the first stage, followed by a random selection of teachers from the above schools ([OECD, 2019d](#)). The target population included schools offering ISCED 2 educational level (representing lower secondary education level, which corresponds to grades 7–9 in most countries), their teachers and principals. For the purpose of the current study we use teacher data at ISCED 2 schools in Austria, Estonia, Malta, Slovenia and Sweden. An overview of the number of participating schools and teachers in the investigated countries is shown in [Table 1](#) below.

Measures

Many items in TALIS teacher and principal questionnaires serve as indicators of latent constructs, which are not directly observable. One example of such construct is teacher job satisfaction. By using a set of items from the TALIS teacher questionnaire, it is possible to formulate latent constructs. TALIS uses the process referred to as scaling to combine several items from a question reflecting a particular latent trait into a single scale score. In brief, scale scores were computed by conducting confirmatory factor analysis with latent variables. A detailed procedure for scale validation and scale score construction is presented in TALIS 2018 technical report ([OECD, 2019d](#)).

To enable the analysis, in which results from different countries can be compared and contrasted, TALIS conducted measurement invariance testing. The statistical procedure, conducted with the help of confirmatory factor analysis ensures that latent scales in different countries are comparable. There are several levels of comparability, referred to as measurement invariance levels, specifically, configural, metric and scalar levels ([Cheung and Rensvold, 2002](#)).

Each level of measurement invariance dictates possibilities for comparisons across groups (e.g., cross-country data analysis and reporting). Configural invariance presupposes comparisons only on a conceptual level; the configuration of items in each group is the same but statistical comparisons are unjustified. Hence, results (e.g., regression coefficients) can only be discussed through reference to each specific country. Metric invariance, in turn, allows comparisons of associations between scales in different countries. Finally, scales with scalar measurement invariance allows for comparisons of the mean scale scores between the participating countries ([OECD, 2019d](#)). For the purpose of the analysis in this study, scales with metric measurement invariance were used, which allow for comparisons of correlations and linear regression analyses.

Table 1 Participating schools and teachers in TALIS 2018 in selected countries.

Source: OECD (2019d), p. 302.

This study employs TALIS-constructed scales (OECD, 2019e) from the teacher questionnaire representing constructs such as teacher job satisfaction, job demands (disciplinary climate, needs for professional development, workload stress), job resources (teacher professional collaboration, classroom autonomy) and a personal resource of self-efficacy beliefs.

Teacher job satisfaction

Teacher job satisfaction was the outcome variable in the study and is a composite score of the two TALIS subscales representing teachers' satisfaction with their school work environment and teachers' satisfaction with the profession. More information about the composite scale and constituting subscales is shown in Table 2 below.

Needs for professional development

The need for professional development represented one of the job demands in the school work environment and included items about teachers' perceived need in the development of content and pedagogical content knowledge. A more detailed information about the scale is provided in Table 3 below.

Disciplinary climate

Teachers' perceived disciplinary climate represented another job demands subdomain and was measured by the corresponding TALIS scale. The item regarding students striving for a pleasant learning classroom climate was reverse coded, so that the direction of the responses pointed toward an unfavorable classroom climate. The scale is described in Table 4 below.

Workload stress

Teachers' perceived workload stress represented one of the job demands and was measured by the corresponding TALIS scale. Information about the scale is provided in Table 5 below.

Table 3 TALIS scale need for professional development in subject matter in pedagogy.*T3PDPED: Needs for professional development in subject matter and pedagogy*

TT3G27: For each of the areas listed below, please indicate the extent to which you currently need professional development.

Response options: "No need at present" (1), "Low level of need" (2), "Moderate level of need" (3), "High level of need" (4).

TT3G27A	Knowledge and understanding of my subject field(s)
TT3G27B	Pedagogical competencies in teaching my subject field(s)
TT3G27C	Knowledge of the curriculum
TT3G27D	Student assessment practices
TT3G27F	Student behavior and classroom management

Source: OECD (2019d), p. 265.

Table 4 TALIS scale teachers' perceived disciplinary climate.*T3DISC: Teachers' perceived disciplinary climate*

TT3G41: How strongly do you agree or disagree with the following statements about this <target class>?

Response options: "Strongly disagree" (1), "Disagree" (2), "Agree" (3), "Strongly agree" (4).

TT3G41A	When the lesson begins, I have to wait quite a long time for students to quieten down
TT3G41B*	Students in this class take care to create a pleasant learning atmosphere
TT3G41C	I lose quite a lot of time because of students interrupting the lesson
TT3G41D	There is much disruptive noise in this classroom

* Reverse coded item.

Table 5 TALIS scale teacher workload stress.*T3WLOAD: Workload stress*

TT3G52: Thinking about your job at this school, to what extent are the following sources of stress in your work?

Response options: "Not at all" (1), "To some extent" (2), "Quite a bit" (3), "A lot" (4).

TT3G52A	Having too much lesson preparation
TT3G52B	Having too many lessons to teach
TT3G52C	Having too much marking
TT3G52D	Having too much administrative work to do (e.g., filling out forms)
TT3G52E	Having extra duties due to absent teachers

Source: OECD (2019d), p. 319.

Table 6 TALIS scale professional collaboration in lessons among teachers.*T3COLES: Professional collaboration in lessons among teachers (subscale)*

TT3G33: On average, how often do you do the following in this school?

Response options: "Never" (1), "Once a year or less" (2), "2–4 times a year" (3), "5–10 times a year" (4), "1–3 times a month" (5), "Once a week or more" (6)

TT3G33A	Teach jointly as a team in the same class
TT3G33B	Provide feedback to other teachers about their practice
TT3G33C	Engage in joint activities across different classes and age groups (e.g., projects)
TT3G33H	Participate in collaborative professional learning

Source: OECD (2019d), p. 252.

Teacher professional collaboration

Teacher professional collaboration represented one of the job resources in the school work environment and was measured by a TALIS scale composed of items concerning lesson collaboration, joint teaching in the same class and providing feedback to each other. The scale is described in Table 6 below.

Teacher autonomy

Teacher autonomy represented one of the job resources and was measured by a TALIS scale composed of items about teachers' perceived control over, for example, course context, teaching, assessment and classroom management methods. A more detailed information about the scale is provided in Table 7 below.

Teacher self-efficacy

Teacher self-efficacy represented a personal resource and was measured by a composite TALIS scale comprised of three subscales reflecting the corresponding theoretical sub-domains: instructional, classroom management and student engagement self-efficacy (Tschannen-Moran and Hoy, 2001). More information about the composite scale and the constituting subscales is provided in Table 8 below.

Table 7 TALIS scale satisfaction with target class autonomy.*T3SATAT: Satisfaction with target class autonomy*

TT3G40: How strongly do you agree or disagree that you have control over the following areas of your planning and teaching in this <target class>?
 Response options: “Strongly disagree” (1), “Disagree” (2), “Agree” (3), “Strongly agree” (4).

TT3G40A	Determining course content
TT3G40B	Selecting teaching methods
TT3G40C	Assessing students’ learning
TT3G40D	Disciplining students

TT3G34: In your teaching, to what extent can you do the following?

Response options: “Not at all” (1), “To some extent” (2), “Quite a bit” (3), “A lot” (4).

TT2G34D	Control disruptive behavior in the classroom
TT2G34F	Make my expectations about student behavior clear
TT2G34H	Get students to follow classroom rules
TT2G34I	Calm a student who is disruptive or noisy

T3SEINS: Self-efficacy in instruction (subscale)

TT3G34: In your teaching, to what extent can you do the following?

Response options: “Not at all” (1), “To some extent” (2), “Quite a bit” (3), “A lot” (4).

TT2G34C	Craft good questions for students
TT2G34J	Use a variety of assessment strategies
TT2G34K	Provide an alternative explanation, for example when students are confused
TT2G34L	Vary instructional strategies in my classroom

T3SEENG: Self-efficacy in student engagement (subscale)

TT3G34: In your teaching, to what extent can you do the following?

Response options: “Not at all” (1), “To some extent” (2), “Quite a bit” (3), “A lot” (4).

TT2G34A	Get students to believe they can do well in school work
TT2G34B	Help students value learning
TT2G34E	Motivate students who show low interest in school work
TT2G34G	Help students think critically

Source: [OECD \(2019d\)](#), p. 285.

Descriptive statistics for the above scales as well as zero-order correlations between the scales are presented in [Appendices A and B](#) respectively. Results from the correlational analysis (see [Appendix B](#)) reveal that the associations between job demands and job resources in the teacher work environment follow the expected direction, i.e., there was a negative relationship between these two domains. Some interesting deviations from this pattern could be observed, however. In Slovenia and Estonia, teachers’ needs for professional development were positively linked with higher levels of professional collaboration between teachers. In all of the countries under analysis, the relationship between job demands, job resources, a personal resource of teacher self-efficacy beliefs and teacher job satisfaction was in the expected direction, i.e., job demands were negatively linked to teacher job satisfaction, while teacher job and personal resources had a positive association with teacher job satisfaction.

Data analysis

Hierarchical linear regression was the main method used in this study. In the first step, job demands in the school work environment were related to teacher job satisfaction. In the next step job resources were entered in the model, including teacher personal resource of self-efficacy beliefs. The analyses were performed with the help of the IEA International Database Analyzer (IDB analyzer) and SPSS 27 software (IBM SPSS Statistics®). The IDB Analyzer is a software that facilitates analyses from international large-scale studies, such as TALIS and was designed by the IEA Data Processing and Research Center ([OECD, 2019e](#)). IDB Analyzer employs stratification weights and accounts for the complex sampling design (teachers nested in schools) in a given analysis. The α -level for all statistical significance tests was set at 0.05.

Fig. 2 Summary of the associations between job demands and teacher job satisfaction.

Results

The relationships between teacher job satisfaction and job demands and resources in the school work environment of the investigated countries are summarized in Figs. 2 and 3 below.

As can be noted from Fig. 2, workload had a negative relation with job satisfaction in all countries. The negative relationship was in fact stronger than that of disciplinary climate which was also negative for all countries. Furthermore, professional development needs were not significantly related to job satisfaction in most countries. In general, teachers who reported having adequate job resources also reported higher levels of job satisfaction. For example, Fig. 3 shows that the more efficacious teachers reported higher job satisfaction although there is some variation across countries. In the following section, results of the regression analyses (provided in Appendix C) for each of the investigated countries are described in more detail.

Relationships between job demands, resources and teacher job satisfaction

In Austria, job demands explained about 8% of the variance in teacher job satisfaction, with workload stress having the strongest negative relationship (-0.20) with job satisfaction, followed by the unfavorable disciplinary climate (-0.17). Teacher's needs for professional development in subject matter and pedagogy were not related to teacher job satisfaction.

Adding job resources to the model explained an additional 5% of the variance in teacher job satisfaction. Teacher self-efficacy beliefs and teachers' perceptions of class autonomy had a positive association, of equal strength, with teacher job satisfaction (0.14), followed by teacher professional collaboration (0.08).

Fig. 3 Summary of the associations between job resources and teacher job satisfaction.

In **Estonia**, job demands explained 9 % of the variance in teacher job satisfaction. Workload stress had the strongest negative association with teacher job satisfaction (-0.27), followed by the disciplinary climate (-0.09). Professional development needs were not related to teacher job satisfaction.

After entering job resources in the model, the explained variance in teacher job satisfaction amounted to 18%. Teacher self-efficacy beliefs had the strongest positive association with teacher job satisfaction (0.20), followed by teacher professional collaboration (0.14), and perceptions of class autonomy (0.10).

In **Malta**, job demands explained about 9% of the variance in teacher job satisfaction, with workload stress having the strongest negative relationship with job satisfaction (-0.21), followed by the unfavorable disciplinary climate (-0.17). Teachers' needs for professional development in subject matter and pedagogy were negatively related to teacher job satisfaction (-0.06).

Adding job resources to the model explained an additional 2% of the variance in the model. Teacher self-efficacy beliefs had the strongest positive association with teacher job satisfaction (0.13). Teacher professional collaboration and teachers' perceptions of class autonomy did not demonstrate any association with teacher job satisfaction.

In **Slovenia**, job demands explained about 11 % of the variance in teacher job satisfaction, with workload stress having the strongest negative relationship with job satisfaction (-0.25), followed by the unfavorable disciplinary climate (-0.14). Professional development needs were not related to teacher job satisfaction.

Adding job resources to the model explained an additional 4% of the variance in teacher job satisfaction. Teacher self-efficacy beliefs had the strongest positive association with teacher job satisfaction (0.17), followed by teachers' perceptions of class autonomy (0.08), and teacher professional collaboration (0.07).

In **Sweden**, job demands explained about 9% of the variance in teacher job satisfaction. The unfavorable disciplinary climate had the strongest negative association with job satisfaction (-0.22), followed by workload stress (-0.18). There was no association between professional development needs and teacher job satisfaction.

Job resources contributed with an additional 3% of the explained variance in teacher job satisfaction. Teacher professional collaboration had the strongest positive association with teacher job satisfaction (0.14), followed by teacher self-efficacy beliefs (0.07). Teacher perceptions of class autonomy were unrelated with teacher job satisfaction.

Discussion

This study aimed to investigate the relationship between job demands and resources (including a personal resource of self-efficacy beliefs) and teacher job satisfaction in five European countries: Austria, Estonia, Malta, Slovenia and Sweden. Results reveal both similar and differing national patterns for the above relationships, which will be discussed in a greater detail in the following sections.

Job demands and teacher job satisfaction

Among the examined job demands in the school work environment, teacher-perceived workload stress was the strongest negative predictor of teacher job satisfaction in all countries under investigation, except for in Sweden. However alarming, this result was not unexpected, as previous research has consistently named teacher workload, and the resulting stress from it, as one of the most common reasons for teacher mental ill-health, burnout, job dissatisfaction and ultimately, attrition (Klassen and Chiu, 2010; Skaalvik and Skaalvik, 2020; Nguyen et al., 2019). Among the analyzed countries, the strongest negative relationship between workload stress and teacher job satisfaction was observed among teachers in Slovenia and Estonia. Even though there is limited research in the field for the above countries, existing studies do point out that the many reforms in the education sector have led to an increase in work demands in general and perceptions of workload in particular, in Slovenia (Rijavec et al., 2016). Similarly, in a study based on Estonian teachers, workload was the main predictor of teacher intentions to leave the profession (Saks et al., 2021). The problem of increased teacher workload due to accountability pressures and a culture of performativity (Perryman and Calvert, 2019) has been discussed in relation to Estonian (Tinn and Ümarik, 2021), Swedish (Allodi and Fischbein, 2012) and Maltese teachers (Cassar and Debono, 2000).

The next job demand in the school work environment -unfavorable student discipline—was the strongest negative predictor of teacher job satisfaction in Sweden, followed by Malta. For the rest of the countries under analysis, student discipline was the second strongest negative predictor of teacher job satisfaction. Student misbehavior has consistently appeared in the literature about Swedish teachers' stress, burnout, job dissatisfaction and attrition (Jacobsson et al., 2001; Toropova et al., 2021). For instance, a study by Jacobsson et al. (2001) using data from 928 comprehensive school teachers in Sweden found that student misbehavior was one of the strongest correlates of teacher stress, together with work demands, and also predicted work demands. In a similar vein, a study on Maltese teachers' job satisfaction and career choices highlighted how student misbehavior and a high teacher workload increased occupational stress and job dissatisfaction among teachers (Borg et al., 1991).

With regards to teacher needs for professional development, no statistically significant associations with teacher job satisfaction were demonstrated in all of the countries but Malta, where a modest link was revealed. Results for Malta find support in previous research, which emphasized both the needs for and provision of teacher professional development opportunities (Bezzina, 2002).

For other countries under investigation, these results were not anticipated, as professional development is known to be an important precursor of teacher professional commitment, effectiveness, and job satisfaction, whereas the lack of opportunities for professional growth are known to lead to work disengagement and job dissatisfaction. The key role of teacher professional development for the success of teachers, students and schools overall is reflected in research on Swedish (Karlberg and Bezzina, 2020), Slovenian (Rijavec et al., 2016), Estonian (Saks et al., 2021) and Austrian teachers (Raggl, 2019).

One of the explanations for the absence of the associations may be the measure “needs for professional development in subject matter and pedagogy,” which taps into the current perceived gaps in professional development in this area. Such needs may be viewed as an integral part of teacher professional lives (Karlberg and Bezzina, 2020), and are thus unrelated to satisfaction with the teaching job. The question which could be more pertinent for their job satisfaction is whether the opportunities to address this and other professional needs are available for teachers, which is better captured by the scale “Barriers to professional development.” Barriers to professional development demonstrated links with teacher job satisfaction in previous research (e.g., Admiraal, 2022). However, this scale could not be employed in the current study due to lack of measurement invariance, which would enable cross-country comparison.

Job resources and teacher job satisfaction

The pattern of the relationships between job resources in the school work environment and teacher job satisfaction was less consistent compared to that of job demands. A personal resource of teacher self-efficacy beliefs emerged as the strongest predictor of teacher job satisfaction in all of the countries, but Sweden. The strongest relationships between teacher self-efficacy and teacher job satisfaction was found in Estonia and Slovenia. The findings for these countries are well in line with previous research (Rijavec et al., 2016; Saks et al., 2021). A meta-analysis of studies involving secondary analysis of TALIS data examining the links between teacher self-efficacy and teacher job satisfaction found a positive association in all of the studies included in the analysis (Kasalak and Dagyar, 2020). Results showing a lack of association in Sweden were unexpected, since positive relationships between self-efficacy beliefs and teacher job satisfaction were found in a number of national and cross-national studies (Björk et al., 2019; Kasalak and Dagyar, 2020; Toropova et al., 2021). One of the explanations could be that the relationship is more complex, with teacher self-efficacy being a mechanism through which job resources influence job satisfaction (Katsantonis, 2020).

Teacher professional collaboration was the strongest predictor of teacher job satisfaction in Sweden, and the second strongest in Estonia. While these results find support in research on Swedish teachers (Jacobsson et al., 2001; Paulsrud and Wermke, 2020), results from studies on Estonian teachers are less consistent. On one hand, the lack of cooperative culture among Estonian teachers, exacerbated by the performativity demands placed on each individual teacher, has been reported (Saks et al., 2021). On the other hand, Estonian teachers may be dissatisfied with the high levels of competition, (Tinn and Ümarik, 2021) and would welcome opportunities for closer professional collaboration, as suggested by the results of this study. No links between teacher professional collaboration and teacher job satisfaction were found in Malta. These results can be explained by the lack of attention to teacher collaborative learning practices in Maltese schools and the related “teacher isolation” phenomena (Attard Tonna and Shanks, 2017).

Teachers’ perceptions of class autonomy was the strongest predictor of teacher job satisfaction in Austria, at par with teacher self-efficacy beliefs, and second strongest in Slovenia. In Malta and Sweden, teachers’ perceptions of class autonomy did not reveal any association with teacher job satisfaction. These results are rather unexpected since international research has pointed out the importance of teacher autonomy for teacher job satisfaction. For instance, a study on Maltese teachers found that teachers’ decision latitude was substantially positively associated with teacher job satisfaction (Cassar and Debono, 2000). In a similar vein, a recent study by Attard Tonna and Calleja (2021) found that a lack of autonomy, occupational stress and a perceived lack of prestige and respect for the teaching occupation contributed to teachers job dissatisfaction and desire to leave the profession in Malta.

A study by Saks et al. (2021) examining teacher retention in Estonia suggested that although teachers may be free in making classroom-based decisions they are limited by the external demands of accountability and performativity, and are thus only able to exercise “restricted autonomy.” These tensions between decision-making and control have been previously explored in the study of autonomy perceptions by the Swedish teachers (Wermke et al., 2019). In a similar vein, the difference in the relationships between teacher autonomy and job satisfaction in Austria and Sweden, with relatively high levels of teacher autonomy on the international scale, may be due to the different governance regimes resulting in complex interactions between decision-making and control in the teaching profession.

Limitations and further research

This study has a number of limitations. First, the cross-sectional design of this study does not allow for causal inferences to be made, and the associations between job demands, job resources and teacher job satisfaction may be bi-directional. Thus, teacher perceptions of job satisfaction may shape their perceptions of job demands and resources. Previous research, however, confirms the direction from the perceptions of work environment factors to job satisfaction for teachers as well as a plethora of other occupations.

Next, the scope of this study only allowed for the investigation of the most salient factors highlighted in previous research as related to teacher job satisfaction. However, teachers experience a myriad of demands and resources, and their complex inter-relationships in their everyday work life. Future research should investigate additional job demands as well as job and personal resources, including the more nuanced relationships between them. For example, examining job resources' potential as a buffer against job demands in the school work environment is of particular importance for teacher job satisfaction.

Further, teacher job satisfaction cannot solely be seen as a function of factors on one level, but rather is the result of a combination of factors on multiple levels. Reflecting an overall complexity of the teaching profession, teacher job satisfaction should be examined considering national, regional, school, classroom and individual teacher factors, and the multiple and complex interrelations between them. Factors like national variations in the organization of the educational system, teacher professional status, school leadership, as well as teacher gender, educational level and teaching experience, are only among the few important factors in explaining differences in teacher job satisfaction. This calls for more nuanced national and cross-cultural research in the area.

Conclusions

This study aimed to investigate the relationship between job demands and resources (including a personal resource of self-efficacy beliefs) and teacher job satisfaction in five European countries: Austria, Estonia, Malta, Slovenia and Sweden. Results reveal both similar and differing national patterns for the above relationships. Overall, job demands demonstrated a more consistent pattern of relationships with teacher job satisfaction across countries, while the associations between job resources and teacher job satisfaction were more varied. Despite different rankings in the teacher job satisfaction levels, teachers in the investigated countries perceived workload stress and classroom discipline as the most critical job demands, while teacher self-efficacy beliefs stood out as an important personal resource.

Results of the study suggest that one way to enhance teacher job satisfaction is to reduce demands faced by the teachers in their school work environment. Another way is to augment teacher work and personal resources, which may potentially act as buffers against high job demands, thus safeguarding teacher job satisfaction. As teacher job satisfaction is closely related to teacher retention, an issue high on the global educational agenda, results of this study could inform policy measures in the investigated countries toward enhancing teacher job satisfaction. It is also hoped that this study encourages more cross-cultural research on teacher job satisfaction and its relation to school work environment factors, in particular in those parts of the world where knowledge in this area is lacking.

Teacher inquiry

Teacher inquiry is a form of professional development that enables, enriches, and extends a teacher’s understanding of their professional practice. As such, teacher inquiry is knowledge generation about one’s practice. There is general consensus that there are three elements to teacher inquiry. The first is the ability to make explicit the particulars of one’s practice relative to the inquiry being undertaken. Second is the ability to make sense of those elements in light of past experience and current knowledge toward new understandings about one’s practice. Finally, it is important to make public those understandings so that they can be part of a larger conversation about professional practice that prompts further refinement and reflection on practice. These elements are presented as distinct from one another in this article but in reality they overlap and unfold in unexpected ways with each interacting and informing the other. Although difficult to visualize, one depiction of teacher inquiry that comes close is that of a Mobius strip (Fig. 1).

It is challenging for any abstraction to fully capture the complexity of practice; for example, not all teacher inquiries unfold in a linear fashion. Also, while there might be a nominal start and end point to a particular inquiry, in truth the idea that sparks one inquiry likely has traces that reach back in time and typically continues to evolve into other questions or inquiries well after the initial inquiry concludes.

Make explicit

The starting point for most teacher inquiry studies is an attempt to make explicit one or more aspects of practice that surprise, intrigue or challenge us in our daily work as teachers. These aspects are often embedded in stories or narratives of practice. As teachers, we have many stories that accumulate over time. Some stories stick in our mind or pique our curiosity more so than others. Often we can’t fully make sense of them in the immediate retelling of the story after the event. However, there is often a nugget within the story that prompts further thinking. In this sense, making explicit our stories of practice is an important first step in attempting to better understand our practice. It is only when we articulate and make explicit aspects of our practice that our stories are available for closer scrutiny. One of the stories from my practice is about Lara, a Year 10 student at East Doncaster High School in Australia.

One Monday during the morning recess break Lara ran up to me in the courtyard and asked excitedly: “Mr. Clarke, Mr. Clarke, did you hear about the contest? Can we enter it?” I had taught Lara a few years previously but hadn’t had a lot of contact with her

Fig. 1 Three elements of teacher inquiry: make sense, make explicit, and make public. (Thanks to Kieran Forde for suggesting this image).

since then. So her sudden approach and exclamation took me by surprise. The competition she referred to was sponsored by a local radio station and the school with the greatest number of empty 'Big M' milk containers would win a live concert at their school by Australia's most popular rock band at that time, the Angels (www.theangels.com.au). After several discussions with the school administration and my teaching colleagues my response to Lara was "Yes."

The above paragraph is an excerpt from my attempt to use teacher inquiry to better understand and make sense of this story in light of my teaching practice (Clarke, 2014). Prior to framing this as a teacher inquiry, I had shared this story of the Angels performing at our school many times with colleagues and friends but I always told it with an emphasis on the Angels. However, after repeated retelling I became increasingly curious about Lara's role in the story. As a result, when I deliberately began to make explicit the key details about this story, its essence shifted and I found myself asking: What if I had said "No" to Lara? The challenge at this point was to make sense of this question in terms of my practice as a teacher at East Doncaster High School.

Make sense

Making sense of one's practice means analyzing or interrogating more fully that which has been made explicit. This move—from identification to interpretation—represents a second important element of teacher inquiry. To appreciate the significance of this shift, it is helpful to understand the emergence of teacher inquiry within the broader context of educational research over time and, in particular, in relation to four distinct trends: (1) research on pupils, (2) research on teachers, (3) research with teachers, and (4) research by teachers (Fig. 2).

Fig. 2 Four trends in educational research over time.

The first trend is associated with a natural sciences approach to educational research that was prevalent in the 1950s. Teacher education research at this time was imbued with a strong cognitive psychology approach to student learning (e.g., a focus on I.Q. tests, knowledge retention, knowledge transfer). This research, referred to as experimental research, was characterized by attempts to isolate elements of learning into discrete units so that they could be the focus of intensive statistical analysis. While it had an impact on education (e.g., policy development), it is generally regarded as having had a relatively minor influence on teaching and learning in the classroom. A second trend emerged in the late 1960s and coincided with a dramatic shift in public interest in education. Events such as Sputnik suddenly brought a renewed focus on schools and schooling, particularly in North America. As a result, educational researchers were forced to rethink their approach to research from focussing almost exclusively on student learning to include teacher actions (Erickson, 1986). Still, many of these experimental and quasi-experimental efforts were based upon linear causal models that implied that professional practice could be regarded as the field of theoretical application (Connelly and Clandinin, 1987), and further, that the knowledge, skills, and competencies required by teachers could be precisely specified in advance (Zeichner, 1987). Much of this process-product, teacher effectiveness, and teacher competency research was based upon a technical rational approach to teaching and learning (Shulman, 1981; Boydell, 1986).

The next trend appeared in the 1980s. As dissatisfaction with a technical rational approach to education became more widespread, alternative research methods emerged (Houston et al., 1989). It was during these years that Zeichner and others sought approval by the American Educational Research Association (the largest educational research association in North America) for a Research Division specifically devoted to teacher education (Zeichner, 1998). The AERA governing body rejected their proposal on the basis that there was insufficient scholarship in the field of teacher education to warrant such a division. However, the governing body felt that if the proposal was to include the “study of teaching” as well as the “study of teacher education” then there would be sufficient grounds for establishing a new division. As a result, a division called “Teaching and Teacher Education” (Division K) was created within AERA in 1984. Division K, with its broader mandate, prompted a shift from research on teachers (which, among other things, was largely objective analyses of teaching actions) to research with teachers (which acknowledged the legitimacy of more subjective analyses of teaching practice) with a corresponding increase in the use of more qualitative research methods.

The early 1990s saw a further evolution of educational research to include inquiries “by teachers.” Evidence of this fourth trend can be found in special theme issues in professional journals at that time, for example, volume 22, issue 3, of *Teacher Education Quarterly*, and the development of special interest groups (SIG) such as the Self-Study of Teacher Education Practices (S-STEP) at AERA. More significantly, an even broader range of research methods was now deemed legitimate in education (e.g., for the first time the use of case study research for a Ph.D. degree in education was allowed in many North American universities). The significance of the fourth trend was that it opened up a color fan of possibilities for teacher inquiry in the new millennium (Tidwell et al., 2009) (Fig. 3).

It is worth noting that although this trend was only formally recognized within academia in the 1990s, it confirmed the earlier writings of Stenhouse (1975), one of the original advocates of teacher inquiry. This long overdue recognition of Stenhouse’s pioneering work confirms, even to this day, the glacial pace of innovation within the academy (Diamond, 2006).

The color fan of possibilities depicted in Fig. 3 lists fifteen forms of teacher inquiry. This is not an exhaustive or definitive list. However, each possibility provides a springboard for making sense of practice. Further, each form provides guidance and direction for advancing various types of teacher inquiry. Some forms require the collection of additional information or data. Others draw on existing sources (e.g., journals, artifacts, memories). The choice of form most appropriate for a particular inquiry is not always obvious at the outset and it may take some time before finding the most suitable form for the questions one asks and the claims one wishes to make. In my case, it took some time for Lara’s story to land on narrative inquiry as the most appropriate form for my teacher inquiry.

Narrative inquiry demands that I set the stage and paint the backdrop to portray as vividly as possible the essence of the key elements of the story. Narrative inquiry uses writing in the form of storytelling as a way to refine and reflect upon practice. When writing Lara’s story, I had to go beyond my own local knowledge and experience and engage with the literature on teaching and learning as the story unfolded. As a result I was better able to situate my inquiry and draw upon a frame for making sense of that inquiry. The outcome of my deliberations was an acknowledgment that I was teaching students, not subjects (Moje, 1996; Palmer, 1997; Sparks and Pole, 2019); a maxim that is old as teaching itself but it took my analysis of Lara’s story for this to have personal relevance for me. This realization was facilitated by my reading of Fenstermacher’s (1992) work which makes the distinction between “a system of schooling” and “an educative agenda.” This distinction highlights the difference between being a teacher and being an educator. Further the evolution of my inquiry was very much a result of sharing my developing understandings with others which brings us to the third element of teacher inquiry.

Make public

For our investigations to be considered teacher inquiry, the outcomes need to be shared with knowledgeable others; that is, we deliberately move the emerging results of our inquiries from the private to the public domain. As noted at the outset, teacher inquiry is about knowledge generation. LaBosekey (2004) argues that an important part of any knowledge generation is that “we formalize our work and make it available to our professional community” (p. 860). Further, as Davis et al. (2003) remind us, the intelligence of the group is always greater than the intelligence of the individual.

Fig. 3 A color fan of possibilities for teacher inquiry.

The use of the phrase “knowledgeable others” is deliberate here. Knowledgeable others might include our colleague in the next classroom. It might include members of a study group within our school. It might include teachers attending a district workshop. It could also include readers of a teacher magazine or professional journal where our work is published. All these are ways of making public our teacher inquiries. As such, they provide opportunities for those with a knowledge of teaching to react and respond to our work which, in turn, presents opportunities to extend and further our own and also the profession’s understanding of practice.

By sharing Lara’s story with knowledgeable others, I was moving my understandings of teaching and learning from the private to the public domain. In doing so, I was opening myself (and my practice) up to scrutiny. Making my story public by sharing it with knowledgeable others and then listening to their feedback was absolutely critical to the new understandings that I gained about my practice. It helped me to think more deeply about *why I do what I do* as a member of the teaching profession.

I first shared fragments of Lara’s story with a small study group who were exploring the “inner work” of teachers and its role in successful teaching practice (Cohen and Bai, 2012). The group asked a number of questions about the story and encouraged me to capture it more fully in written form. After much to-ing and fro-ing, I decided on narrative inquiry as the most appropriate form for doing this. When my writing was sufficiently coherent, I shared Lara’s story with other teachers and colleagues at a local workshop and later at a provincial conference. The feedback I received prompted further analysis and refinement of the story (Clarke, 2014).

As noted above, narrative inquiry is one of a range possibilities for teacher inquiry. In the section that follows, a summary of fifteen other forms of teacher inquiry is provided as a stepping stone for thinking further about teacher inquiry as a form of professional development in practice settings.

A color fan of possibilities

The color fan of possibilities depicted in Fig. 3 lists various forms of teacher inquiry that have been defined and used in educational research. As such, they provide substantive examples of how teacher inquiry has been taken up by practitioners. There are undoubtedly other forms of teacher inquiry that are being explored at the present time and will at some point become part of the educational research lexicon. A quick perusal of the fifteen forms suggests some overlap between forms and, in some cases, only very slight or subtle shades of difference. For example, narrative inquiry and pedagogical narration share storytelling as a central component of the inquiry process. Sometimes teacher inquirers use variations of 15 forms or combine them with other social science practices to create a distinct approach suitable for their context. For example, Participatory Action Research (MacDonald, 2012) is a combination of action research and a “Communities of Practice” (CoP) model for professional development (Lave and Wenger, 1991). Some forms are difficult to neatly categorize because of their broad ambit (e.g., Scholarship of Teaching and Learning or SoTL).

Nonetheless, each form provides teachers with a way of advancing their understandings of practice. The descriptions provided here are meant as starting points for exploring possible forms of teacher inquiry that can be taken up in educational settings.

Action research (AR) ... is distinguished by its emphasis on “teacher action”

Action research, as the name implies, places a strong emphasis on “action.” In particular, the anticipated outcome of action research is a change in one’s practice. Action research is a cyclical process with four distinct phases per cycle: plan, act, observe, and reflect. The outcomes from one cycle are used as the basis for continued exploration of practice in the following cycle. Thus, each cycle potentially leads to new understandings of practice. One of the greatest appeals of action research is tangible improvement in practice with direct benefits for both the teacher and the students. One of the earliest attempts to articulate action research as a form of inquiry was by [Lewin \(1946\)](#). Other useful references for AR include:

Quality teaching rounds (QTR) ... is distinguished by its emphasis on “rounds of teaching”

Quality Teaching Rounds (QTR) is a recent Australian initiative and occurs within the context of Professional Learning Communities (PLCs). QTR is based on series of instructional rounds focused on a particular aspect of pedagogy as decided by the PLC. QTR has echoes of hospital teaching rounds used in medicine where the immediacy of the action setting is the crucible for learning. An instructional round is held over the course of a single day and involves reading a text or related article, an observation of a lesson taught by one of the teachers from the group, followed by “a rigorous diagnostic professional conversation” ([Gore et al., 2017](#), p. 100) by the group. Each member of the group teaches at least one lesson as part of the QTR process and the members stay together for an entire set of rounds. A key characteristic of QTR is the intense juxtapositioning of literature, observation, and conversation. Useful references for QTR include:

Bowe, J., Gore, J., 2016. Reassembling teacher professional development: the case for quality teaching rounds. *Teach. Teach.* 23(3), 352–366. doi: 10.1080/13540602.2016.1206522.

Lesson study ... is distinguished by its emphasis on “lesson design”

Lesson Study (“jugyuu kenkyuu”) originated in Japan in the 1990s. It is teacher-led inquiry where a small group of teachers collectively identify an aspect of a lesson that they are seeking to better understand or improve through the development of a more appropriate lesson design. They plan, teach, observe, and reflect upon the same “research lesson” ([Fernandez, 2002](#), 394) as taught by various (but not necessarily all) members of the group. Thus, lesson design and re-teaching of the same lesson are central to lesson study. Useful references for lesson study include:

Elliott, J., 2019. What is lesson study? *Eur. J. Educ.* 54(2), 175–188. doi: 10.1111/ejed.12339.

Learning study ... is distinguished by its emphasis on the “object of learning”

Learning study originated in Hong Kong and is similar to lesson study in many ways. However, a distinguishing feature is that it always takes the “object of learning” as its starting point (i.e., what is to be learned). Further, learning study is always grounded in a theory of learning. To date, proponents of learning study have typically drawn upon variation theory ([Martin, 2015](#)), which has its basis in phenomenography ([Martin 1986](#)). Proponents of variation theory contend that learning results from the experience of difference, and that difference is what allows learners to discern the critical features of a particular phenomenon. [Runesson \(2015\)](#) argues that “variation theory synthesized with other theories might contribute to a further development of learning study” (e.g., the use of cultural historical activity theory or CHAT).

Useful references for learning study include:

Scholarship of teaching and learning (SoTL) ... is distinguished by its shift from scholarly approaches to teaching to the “scholarship” of teaching

SoTL is a form of inquiry into practice undertaken by college and university professors in Higher Education. SoTL emphasizes the difference between scholarly approaches to teaching and learning and the scholarship of teaching and learning (Richlin, 2001). SoTL researchers view classrooms and related university learning spaces (such as labs, tutorials, field experiences) as sites for inquiry into practice. SoTL also encompasses other forms of inquiry into practice such as the Scholarship of Curriculum Practice (SoCP) and the Scholarship of Educational Leadership (SoEL). SoTL practitioners often begin with investigation methods consistent with the signature pedagogies in their academic disciplines and then expand beyond those methods over time and as appropriate. Not all SoTL inquiries fall strictly within the definition of teacher inquiry, however the majority do. Useful SoTL references include:

- Boyer, E.L., 1991. The scholarship of teaching from: scholarship reconsidered: priorities of the professoriate. *Coll. Teach.* 39, 11–13. doi: 10.1080/87567555.1991.10532213.

Appreciative inquiry (AI) ... is distinguished by its initial emphasis on “what’s working”

In stark contrast to many approaches to teacher inquiry that start by identifying an issue, problem or challenge, AI begins by articulating “what’s working” (Kung et al., 2013, p. 3) in one’s practice. Practitioners then use that as the starting point and platform for their inquiries into practice. Because of this very distinct approach to teacher inquiry, AI is referred to as a strengths-based, positive approach to change. AI is often associated with system-level change within organizations but the principles of AI are equally applicable to individual classroom contexts. AI typically has four stages that practitioners move through during their inquiries: discovery, dream, design, and destiny. The beginnings of appreciative inquiry can be traced back to the early work of Cooperrider and Srivastva (1987). Useful references for AI include:

- Giles, D., Kung, S., 2010. Using appreciative inquiry to explore the professional practice of a lecturer in higher education: moving toward life-centric practice. *Aust. J. Adult Learn.* 50(2), 308–322.
- Kaplan, C.S., 2014. An appreciative inquiry approach to reflecting on teaching. *Lang. Educ.* 9(3), 44–47.

Self-study ... is distinguished by its emphasis on “the self in teaching”

Self-study as a form of educational research came to prominence in the 1990s when a group of teacher educators in colleges and universities began to deliberately explore, critique, and publish inquiries about their teaching practices (Loughran, 2004). In 1994, the American Educational Research Association (AERA)—arguably the largest association of educational researchers in North America—permitted these professors to establish a Special Interest Group (SIG) within AERA. The SIG, called as Self-Study of Teacher Education Practices (S-STEP), has since developed forums, journals, and international handbooks to support this form of teacher inquiry. Today, the ripple effect of S-STEP is felt across all levels of education as self-study has moved from the shadows of academia into the full light of legitimate educational research.

In the beginning “the self” for S-STEP practitioners was understood to be the individual. However, debates quickly arose within S-STEP about what constituted the unit of analysis for “the self.” For example, could a science department using the principles of S-STEP conduct a self-study where “the self” was the department? Subsequent S-STEP studies suggest this is possible. Finally, proponents of self-study have steadfastly held to the term self-study to describe their inquiries while drawing upon a multitude of approaches and strategies for those inquiries. Useful references for self-study include:

- Loughran, J.J., 2004. A history and context of self-study of teaching and teacher education practices. In: Loughran, J.J., Russell, T.L., (Eds.), *International Handbook of Self-Study of Teaching and Teacher Education Practices*, Springer, Dordrecht, pp. 7–39. doi: 10.1007/978-1-4020-6545-3_1.
- Austin, T., Senese, J., 2004. Self-study in school teaching: teachers’ perspectives. In: Loughran, J.J., Russell, T.L., (Eds.), *International Handbook of Self-Study of Teaching and Teacher Education Practices*, Springer, Dordrecht, pp. 1231–1258. doi: 10.1007/978-1-4020-6545-3_32.

Insider research ... is distinguished by its emphasis on “positionality”

Insider research is the analysis of practice from the unique perspective of someone from “inside” the practice. As an insider, the practitioner possesses intimate knowledge of the practice under study. Thus positionality is an important aspect of insider research:

Positionality refers to the stance or positioning of the researcher in relation to the social and political context of the study—the community, the organization or the participant group. The position adopted by a researcher affects every phase of the research process, from the way the question or problem is initially constructed, designed and conducted to how others are invited to participate, the ways in which knowledge is constructed and acted on and, finally, the ways in which outcomes are disseminated and published.

Rowe (2014, p. 628).

Further, insider knowledge may differ from one insider to another insider within the same practice. Thus, the imperative for those engaged in insider research is that “you have to position yourself somewhere in order to say anything at all” (Hall, 1990, p. 18). Cochran-Smith and Lytle (1993) were among the first to write about insider research as a form of teacher inquiry. Other useful references include:

Narrative inquiry ... is distinguished by its emphasis on “story”

Narrative inquiry is the study of experience interpreted by and through stories of practice. For Connelly and Clandinin (1990), “Humans are storytelling organisms who, individually and collectively, lead storied lives” (p. 2). Stories embody knowledge accumulated and experience gained over time. Narrative inquiry is one way of making sense of that knowledge and experience. In the process of telling a story, the teacher inquirer sets the stage and paints the landscape as vividly as possible to portray the essence of the event(s) that are the focus of the inquiry. The inquirer emphasizes some elements and relegates others to background color. Each of these decisions requires one to pause, think, and then act—that is, to make judgments about what is important and relevant to the story as it unfolds. Useful references for narrative inquiry include:

- Bell, J.S., 2002. Narrative inquiry: more than just telling stories. *TESOL Quart.* 36(2), 207–213. doi: 10.2307/3588331.

- Huber, J., Caine, V., Huber, M., Steeves, P., 2013. Narrative inquiry as pedagogy in education: the extraordinary potential of living, telling, retelling, and reliving stories of experience. *Rev. Res. Educ.* 37(1), 212–242. doi: 10.3102/0091732X12458885.

Pedagogical narration ... is distinguished by its use of “multimedia” to tell a story

Pedagogical Narration is the systematic documentation of teaching practice through multimedia, including text, images, and artifacts. Using multimedia to make learning visible emerged in the late 1970s within the context of early childhood settings, in particular, Reggio Emilia (Giudici et al., 2001). Pedagogical narration allows for the assemblage of one’s practice in ways that are not always possible in more traditional forms of documentation. This assemblage provides alternative ways of seeing and noticing that practice, leading to new insights and understandings. Pedagogical narration is not a bulletin board of disconnected artifacts. Rather it is a deliberate and intentional construction in terms of inviting curiosity, wonder, and engagement. As Browne et al. (2010) argue, “when we document children’s learning, we consider and reflect on what the children may be thinking, doing, and/or learning and then apply these insights to the unique manner of teaching them” (p. 49). Thus, pedagogical narration has the potential to make both children’s and teachers’ learning visible. Useful references for pedagogical narration include:

Autobiography ... is distinguished by its emphasis on “pattern”

Autobiography provides the opportunity to understand “the self” over time by exploring the patterns that define one’s life. It is argued that an understanding of oneself is critical in any attempt to understand others and the world about us (Böckler et al., 2017). Autobiography is a highly personal endeavor: “it is ... simultaneously historical record and literary artifact, psychological case history and spiritual confession, didactic essay and ideological testament,” (Stone, 1981, p. 80). Thus, what one includes and why it is included are all “in play” in an autobiographical account. Sometimes the veracity of autobiographical accounts cannot be confirmed externally because they are stories written by oneself about oneself:

Autobiography is not the story of a life; it is the recreation or the discovery of one. In writing of experience, we discover what it was, and in the writing create the pattern we seem to have lived. Simply put, autobiography is a reckoning.

Heilbrun (1995, p. xvii).

Autobiographies are not always linear in their construction and it is the patterns that emerge that say more about one’s teaching life than the fullness of the account itself. Useful references for autobiography include:

- Davis, N.T., 1996. Looking in the mirror: teachers’ use of autobiography and action research to improve practice. *Res. Sci. Educ.* 26(1), 23–32. doi: 10.1007/bf02356961.

Autoethnography ... is distinguished by its emphasis on “the self in context”

Mishler’s (1979) rhetorical question: “Meaning in context: is there any other kind?” speaks to the importance of context in making sense of who we are and what we do as educators. Thus, for autoethnographers, the self is part of a larger picture. Denshire (2014) argues that autoethnographic accounts “can function as something of a corrective” (p. 833) to highly personalized and therefore potentially decontextualized accounts of practice. In this sense, autoethnographic writing is a relational endeavor seeking to understand one’s practice in light of the political, social, and cultural contexts in which it is embedded. Useful references for autoethnography include:

- Ellis, C., Adams, T., Bochner, A., 2011. Autoethnography: an overview. *Forum*, 12(1), Article 10, pp. 1–13. Retrieved: <http://nbn-resolving.de/urn:nbn:de:0114-fqs1101108>.

Life history ... is distinguished by its emphasis on “temporality”

Those who take up life history as a research method have a particular interest in understanding the connection between people, places and events over time. Thus, temporality is central to life history. Bullough and Gitlin (1995) argue that “To know the past is to know oneself as an individual *and* as a representative of a socio-historical moment in time; like others each person is a victim, vehicle, and ultimately a resolution of a culture’s dilemmas.” (p. 25). As with any historical account there is the expectation that life history is based and draws upon on reliable and verifiable sources. For some researchers, such as Watson and Watson-Franke (1985), life history is “any retrospective account by the individual of his life in whole or in part, in written or oral form, that has been elicited or prompted by another person” (p. 2). Thus, traditionally, a life history is written by somebody other than the person whose history is being written. However, it is on this point that Fitzpatrick’s (2011) question becomes relevant here: “Can You Write a History of Yourself?” Although Fitzpatrick found this difficult to do (she made the shift to autobiography), Samaras et al. (2004) argue that:

Personal history self-study is increasingly becoming an essential methodology towards teacher educators’ personal and professional growth and especially to improving their teaching practice and impacting their students’ learning. Through a personal history self-study approach, professors and their students are able to reconstruct significant life events to inform them of their professional identity formation and to help them make meaning of their pedagogy and the connections of their practice to theory. (p. 905)

(Eds.), *Conceptualizing Reflection in Teacher Development*, London, The Falmer Press, pp. 70–92. doi: 10.4324/9780203209851_chapter_5.

Memoir ... is distinguished by its emphasis on “memory”

Memoir draws on a variety of elements in making sense of one’s practice. Perhaps its most defining characteristic is the use of memory. Keightley (2010) notes: “The turn to memory in social research enables the role of the past in the present to be explored. ... Not simply concerned with the past, memory studies are concerned with the ways memories respond to the demands of current experience and future desires ...” (p. 67). One reason for this response is that, as humans, we try to overcome cognitive dissonance and therefore attempt to align our emotions, behaviors, and practices in terms of what we remember (Ghalipour, 2017). Therefore, memoirs are more reflective than reportorial; they reveal as much about feelings as they do about facts (Radden and Varga, 2013). Useful references for memoir include:

- Boylorn, R., 2008. Memoirs. In: Given, L. (Ed.), *The SAGE Encyclopedia of Qualitative Research Methods*, Thousand Oaks, SAGE Publications, Inc., pp. 505–506.

Portraiture ... is distinguished by its emphasis on “esthetics”

Lawrence-Lightfoot and Davis (1997) argue that portraiture “blurs the boundaries of esthetics and empiricism in an effort to capture the complexity, dynamics, and subtlety of human experience” (p. xv). The portraiture combines scientific aspects of inquiry through systematic use of observation, interviews, and other forms of data collection to describe phenomena, while simultaneously capturing the beauty and esthetic properties of phenomena (Quigley et al., 2015, p. 21). This form of teacher inquiry is perhaps the most expressive, and possibly artistic, of all the forms discussed thus far. Carl Leggo (2014), a renowned educator and poet, exemplifies this sort of writing in a recent publication that is replete with photographs and poetry in combination with regular text:

I grew up in a working-class home where few photographs were taken. It was too expensive to pay for film and developing. So, the entire collection of photos from my childhood is approximately fifty images. This is the whole of a working class family archive. Therefore, the school photos of elementary school are especially significant because they are a part of a small collection. I don’t have photos of high school classes. Most of the photos are black and white, and most are blurry or faded. Nevertheless, when I look at the photos, I am struck by the still seriousness in so many of the images. Like Barthes (2010), I see in these images something irreducible in my childhood: “everything which is still in me, by fits and starts” is “in the child” (p. 22). Above all, I see fear in the face of the child in so many of the photos. (p. 63)

Useful references for portraiture include:

All of the above forms of teacher inquiry require practitioners to make explicit, make sense, and then make public their explorations of practice. These explorations can include personal and professional dimensions in various measures. The outcomes contribute to one’s understandings of practice and encourage all of us to think more deeply about *why we do what we do*. Further, the outcomes advance understandings of the profession where both teachers and students are the beneficiaries.

Professional practice: what's inquiry got to do with it?

For someone to be a member of a profession it is incumbent upon them to meet a number of expectations. For example, a professional needs to meet the qualifications stipulated for entry into a particular profession, abide by the ethical principles of that profession, and be accountable to the regulatory body that oversees the profession. Furthermore, and perhaps most importantly, professionals must always be knowledgeable about the latest developments in their field and, in turn, ensure that that knowledge becomes a part of and is embedded in their daily work. In short, they must be curious, inquisitive, and generative in sustaining and maintaining their professional practice. Failure to do so means that their practice becomes perfunctory, routinized, or even duplicative.

Practice becomes perfunctory when we lose interest in *why we do what we do*. Our practice becomes routinized when we simply do tomorrow exactly what we did today regardless of the contexts or circumstances in which we find ourselves; we become automatons. Our practice becomes duplicative when we surrender our agency as professionals and mindlessly copy or mimic what others do. When our practice is perfunctory, routinized, or duplicative it becomes labor or technical work. Laborers follow a predetermined plan of action provided to them by others in order to achieve a particular goal. Technicians have the opportunity to choose a plan of action from among a set of predetermined plans which are provided to them in order to achieve a particular goal. Professionals differ from laborers or technicians in that they have the freedom to plan their own course of action to achieve a particular goal. For example, the Ministry of Education might set out particular curriculum goals but teachers have freedom to develop their own plans of action for implementing those goals in their classrooms. As noted above, exercising that right requires teachers to be curious, inquisitive, and generative in the daily enactment of their professional practice. These dispositions are embedded in professional standards for teachers in most jurisdictions throughout the world. For example, in the United States, the National Board for Professional Teaching Standards (NBPTS) notes that teachers as professionals:

... serve as paradigms of lifelong learning and achievement. ... Moreover, they epitomize the intellectual capacities they foster: the ability to reason carefully, consider multiple perspectives, question received wisdom, adopt an inquiry-based approach, solve problems, and persevere. In all aspects of their action and demeanor, accomplished teachers convey the significance of reflection and learning ...

NBPTS, p. 33.

Similarly, the Australian Institute for Teaching and School Leadership (AITSL), which is responsible for establishing the standards for teaching in Australia, stipulates that it is the responsibility of all teachers to “identify their own learning needs and analyze, evaluate and expand their professional learning both collegially and individually” (AITSL, 2018, p. 5). In sum, teacher inquiry—the desire to make explicit, make sense, and make public—is what provokes, nourishes, and advances deeper understandings and broader conceptualizations of teaching and learning. In sum, inquiry is a defining feature of professional practice.

Introduction

An essential element of inclusive education involves ensuring that all teachers are prepared to teach all students, as worldwide they are working with increasingly diverse groups of students in inclusive practices. This calls for teachers to have opportunities to engage with inclusive education theories, policies, and examples of practice through their professional education, both initial education and professional development.

Inclusion can be realized when teachers see themselves as agents of change, with the values, knowledge and attitudes that allow every student to succeed (UNESCO, 2020). Preparing teachers reflects the standards and qualifications in each country context. But a common theme is that education systems are moving away from focusing on the learner as a problem and toward “identifying barriers to learning and participation and providing anticipatory responses, planning for all learners up front” (European Agency for Special Needs and Inclusive Education, 2015, pp. 14–15).

A recent audit of the Icelandic system of inclusive education, conducted by the European Agency for Special Needs and Inclusive Education, concluded that there is a strong foundation in legislation and policy in line with the relevant international conventions (European Agency for Special Needs and Inclusive Education, 2017). The legislation builds on a broad conceptualization of inclusion as an education system built on justice and equity, enabling all learners to participate, make progress and enjoy learning. Findings from the audit show, however, that the implementation of the legislation into practice has not been straightforward. Furthermore, many teachers and administrators question the degree to which their initial education and/or ongoing professional development opportunities have prepared them for the realities of inclusive practices and to what extent they are enabled to implement inclusive education as a rights-based approach for all learners (European Agency for Special Needs and Inclusive Education, 2017).

According to Óskarsdóttir (2014), teachers report that they are not prepared to teach diverse groups of students. They believe they need more knowledge on different disabilities, learning difficulties, behavior problems and how to work with learners with diverse language backgrounds. However, the problem is not that inclusive education is not addressed in the teacher education program; the problem is that there is no consensus on the emphasis in the program because teacher educators have different views as to how to prepare teacher students to work in inclusive settings. Some courses at the University of Iceland respond to inclusive education by focusing on developing teachers' knowledge of various learning disabilities, while others focus on building teacher competences in designing their practice to be effective for all learners (Guðjónsdóttir and Óskarsdóttir, 2020). This is similar to what can be seen out in the field, different understandings result in different responses (Cochran-Smith and Dudley-Marling, 2012; Forlin and Chambers, 2011; Florian and Pantić, 2017).

Courses offered at UI will continue to emphasize different aspects and build on different theoretical approaches (Forlin and Chambers, 2011). However, each course should be seen as a piece in the puzzle of a complete teacher education that prepares student teachers for their role in the inclusive education system. This can be achieved by enabling them to build their personal theoretical framework, choose pedagogical approaches and to take a disciplinary stance.

In this article we explore a graduate course taught at the School of Education, University of Iceland, grounded in a pedagogy that integrates professional knowledge about teaching, learning and child development, and involving an ethical and social commitment to all students. We examine two main themes: inclusive pedagogy, and the professionalism of teachers. Through these two themes, the aim is to clarify important issues in the preparation and ongoing professional development of teachers working in inclusive practices in Iceland. Our research question is: What kind of learning environment in teacher education would push our students to take a stance and responsibility toward inclusive practices? Analyzing and interpreting data from the course, we will discuss how professionals are tutored to realize their theoretical and pedagogical stance and to be critical as they influence the teaching, learning and reconstruction of inclusive schools.

Theoretical framework

The theoretical framework for this paper centers around inclusion, inclusive pedagogy, teachers' professional identity and teachers' education pedagogy. Each of these concepts is briefly defined in this section.

Inclusion

Inclusive practice is fundamentally grounded in the ideologies of social justice, democracy, human rights, and full participation of all (UNESCO, 2020). These ideologies are connected and interdependent in various ways. A socially just education system is premised on the idea that quality education is the democratic right of all, rather than a prize to be competitively fought for (Reay, 2012). This idea is integral to inclusive education systems as those advocating for social justice seek a world that is fair and equitable toward everyone, not a world where everyone gets the same opportunities in order to reach the same goals.

The development of how inclusion is defined focuses on the notion of diversity, rather than disability, and how schools respond to and value a diverse group of pupils (Florian, 2021). Diversity is a natural attribute of a school community, mirroring the wider community, and can be explained as the range of elements that result in a perception of difference among people. Inclusion is aimed at steering attention toward inequalities presented in marginalization, exclusion and discrimination against diversities such as social and ethnic circumstances, religion, gender, ability of students and their families (UNESCO, 2020). Thus, inclusive education can be seen as a movement against marginalization and exclusion and an adverse reaction to social inequality (UNESCO, 2015). As such, it is an ongoing process focusing on continuous development, working against inequality, and enhancing people's sense of belonging in school and society.

Furthermore, inclusion implies a shift from emphasizing the source of learning differences or difficulties in school as coming from within the pupil or stemming from his/her social circumstances to viewing the problem as the influence of the system of education or the environment (Schuelka et al., 2019). School is then a place where difference is understood as fundamental to human development and the aim is to create rich learning environments for all students through differentiation, focusing on what is to be taught rather than who is to learn it (Óskarsdóttir et al., 2018). Developing inclusive practice demands that teachers and other school personnel maintain a welcoming disposition toward diversity, an understanding of learning as a creation of meaning and an assumption that all pupils are competent (Biklen, 2020; Guðjónsdóttir and Óskarsdóttir, 2016; Hart et al., 2007). So, rather than expecting pupils to assimilate to existing school and subject structures, the curricula, teaching practices and learning situations must mirror the inherently diverse human nature.

Inclusive pedagogy

The term pedagogy appears in the educational literature to explain the various and composite tasks involved in the act of teaching. Three consistent uses of the term "pedagogy" can be found in the literature; (a) to cover teaching methods, instructional programs and curricula; (b) as an all-embracing term for education in poststructuralist thought; and (c) to express and address moral education and discourse about teaching and learning (Bruner, 1996; Freire, 2005; Van Manen, 1991, 1999). In this article the term pedagogy is understood in accordance with the definition by Alexander (2013) as composed of the act of teaching and the ideas, values and beliefs informing, sustaining, and justifying that act.

The distinction of pedagogy employed in an inclusive school is that it is based on the ideas of equity and a fundamental change in how teachers approach and think about pedagogy:

- From a focus on traditional, individualized approach to learner diversity that begins by preparing for most pupils and then offering something additional (special) to some learners identified as having special needs.
- Toward an inclusive pedagogical approach that begins with the learning of everybody, focusing on how to create rich learning opportunities and make them available to all learners so that everybody can participate in the classroom community (Black-Hawkins, 2017).

This means that teachers (and others) need to move away from a focus on diagnostic labels attached to pupils. Categories of diagnosis and their associated labels can negatively affect how teachers think about a pupil's ability and are problematic for a number of reasons. They support a deficit model of learning where the pupil is viewed as "faulty" and in need of repair, rather than focusing on an exploration and development of the learning context. Diagnostic categories can overlap, and there are huge variations between people identified as being members of the same group. Focusing on those categories and labels provides an oversimplified view of a person and lacks the richness and complexity inherent in everyone's life (Black-Hawkins, 2017). The very act of focusing on difference intensifies the isolation and marginalization of children and adds to the social construction of disability (Grenier, 2010).

The alternative is to focus on what is to be taught and how this can be presented to accommodate diverse ways of learning (Florian and Spratt, 2013). The practice of teaching diverse groups of pupils is grounded in a pedagogy that includes more than a skill in using prescribed instructional practices. Rather, this practice integrates professional knowledge about teaching, learning and child development, and involves an ethical and social commitment to children. Pedagogical qualities of the responsive professional teacher are witnessed in teachers who understand child development and individual differences, are committed to the education of all pupils, and who have a knowledge base enabling them to differentiate between pupils as they develop a curriculum for all pupils (Guðjónsdóttir, 2000).

Teaching for equity, where teaching practices that presume diversity from the beginning are employed and built on a recognition of pupil resources, can be considered simply as good teaching for all. All pupils bring valuable resources and experiences to the classroom. These resources are their talents, strengths, and skills, built upon their personal experience, knowledge, and beliefs. Teachers who understand their pupils' resources can better attune their teaching to the resources pupils bring to the classroom. Gonzalez et al. (2005) see culture as "funds of knowledge" or, in other words, a resource to draw upon in the process of learning and empowering of pupils.

These connotations of inclusion challenge all teachers to investigate their values and beliefs, to reflect on their understanding of teaching, learning and curriculum, and to reinvent their roles as participants in school change. Through the recognition of their identities, their unique qualities and their roles, teachers have more opportunities to empower their pupils. Realizing that they are the makers of their culture and by showing their knowledge and understanding of the complexity and diversity of the world in which their pupils live they can become cultural workers (Freire, 2005). In working with diverse pupils, it is critical that teachers understand how their own identities influence the ways they work and how they respect the value of diverse identities. People tend to look at those who are different from themselves as inferior (Freire, 2005). Teachers that become aware of this central problem, aware of their own prejudices, take a special stance and make sure their beliefs do not hinder them from transferring their cultural work.

Teachers' professional identity

Understanding teachers' professional identity defined as the beliefs, values, and commitments an individual holds toward being a teacher can help them to understand who they are as teachers (Sachs, 2001). For teachers, professional identity is mediated by their own experience in schools and outside of schools, as well as their own beliefs and values about what it means to be a teacher and the type of teacher they aspire to be. Identity is not something one has, but something that develops during one's whole life and is not a fixed entity but an ongoing process of interpretation and re-interpretation of experiences, beliefs and knowledge (Sachs, 2005). Teacher values are important resources to enrich the quality of teaching and learning experiences for teachers and their students. Knowledge of both themselves and their personal values can help teachers handle the challenges of their practice and well-being (Barni et al., 2019).

Agency is an important element of professional identity, meaning that teachers have to be active in the process of professional development (Coldron and Smith, 1999). Teacher agency is not something that teachers can have, rather it is something they do or achieve (Biesta et al., 2015). It is a developing phenomenon with a focus on past, future and present, but only acted in the present as it is about the interplay between what teachers bring to their practice and what the practice brings to them. If teacher agency today is influenced by experiences from the past, then it can be assumed that today's contexts will impact the future agency of teachers (Priestley et al., 2015). Risk taking and changing practice calls for a professional agency where individuals act independently and make their choices. Teacher professional agency represents how teachers define themselves both to themselves and to others and how they respond to theoretical ideas or government acts (Biesta et al., 2015). Teachers practice professional agency as they influence, make choices, and take a stance in a way that affects their work and their professional identities (Eteläpelto et al., 2013). It is formed through their lived experiences, dialog and internal conversation and its development is shaped by historical, sociological, psychological, and cultural influences (Dalmau and Guðjónsdóttir, 2017). By creating a space in teacher education for student teachers and their tutors to reflect on their practical experience, educational theories, or knowledge, and ethical or moral principles they are given an opportunity to recognize their professional identity. Using multifaceted ways together with multi-dimensional, multi-layered, and dynamic processes student teachers and their tutors can identify their professional agency (Dalmau and Guðjónsdóttir, 2017).

Teacher education pedagogy

The philosopher Skúlason (1989) had the following to say about the art of teaching:

To teach is even harder than to learn. People know this, but seldom think about it [...]. Teaching is harder than learning because teaching means getting people to learn [...]. A teacher is not ahead of students except to the extent that he has to learn much more than they do because he must get them to learn (p. 10).

Teaching people to become teachers can, therefore, be a complex profession because it is more than simply delivering information about the content of a subject or about teaching methods (Loughran, 2013). The pedagogy of teacher education focuses on the complex interplay between human, material, and non-tangible elements (Hordvik et al., 2020). It is about understanding how this complex interplay influences the relationship between teacher and student, student and student, and learner and subject matter, encompassing both context and content (Loughran, 2013). In their teaching, teacher educators have to take into account the different ways people learn when making decisions about how they teach people to become teachers. There is value in giving student teachers space to understand what kind of teachers they aspire to be, and in that space teacher educators give precedence with their teaching, showing how learning influences teaching and the way we teach. On the other hand, teacher educators need to acknowledge the fact that it is beyond their agency to address all the uncertainty, ambiguity, and unpredictability that characterizes the practice of teaching (Hordvik et al., 2020). In the face of this, teacher educators need to support teacher students in developing a mindset of hope, of looking at challenges as opportunities for growth and new learning.

Preparing teachers for working in inclusive school settings is a key factor in teacher education; a factor that requires teachers and teacher educators to take the initiative to move out of their comfort zone, risking uncertainty while exploring new or diverse ways of working, planning, and organizing (Guðjónsdóttir and Óskarsdóttir, 2020). Seeking collaboration with colleagues to problem solve, debate, and celebrate success, where each contributes through individual strengths and interests, can support teachers in this endeavor. The effort to develop inclusive practice will be rewarded with more effective classrooms that can reach and engage a broad spectrum of pupils in an equitable way.

Responsiveness, coupled with pedagogical skills, enables teachers to use pupil differences, contextual issues, cultural and community events, subject matter, and problems and challenges as opportunities for effective teaching and learning. However, responsive teachers go beyond acknowledging and respecting differences as they create the curricula. They focus on pupils and what they bring into the classroom in the shape of their resources (ability, attitude, background, experience, interest, knowledge, and skills), and respond by designing a universal learning environment that supports all pupils in expanding their learning (Guðjónsdóttir, 2000). Responsive teachers are skilled in creating a curriculum of learning activities and environments in which all pupils can succeed. This means that the responsive teachers' preparations are solidly grounded in major theoretical perspectives on child development and their practical applications, in an understanding of the social and moral issues inherent in individual differences, as well as in a strong professional commitment to the education of pupils (European Agency for Development in Special Needs Education, 2011; Guðjónsdóttir, 2003; Guðjónsdóttir et al., 2007).

Methodology and methods

The research builds on the methodology of self-study of teaching and teacher education practices (S-STTEP), where we as the researchers and teacher educators focus on inclusive education in our practice through the critical and collaborative lens of self-study (Bodone et al., 2004). The critical focus was employed to reveal the position of dominant practice to support us in becoming more conscious of both the transformation that takes place and the process that leads to that transformation (Kincheloe, 2003; Pin-negar and Hamilton, 2009). The S-STTEP methodology was a frame for us to examine the course; it was a way to think about and discuss our practice in collaboration (Tidwell and Staples, 2017). Thus, we shared reflections about our responses and the development of practice. The purpose of this research was to gain an insight into how teacher education can respond to the call for preparing teachers to be responsive, see themselves as agents of change, with the values, knowledge and beliefs that allow every learner to succeed. The aim was to cast a light on important issues in the preparation and ongoing professional development of teachers and student teachers. Our research question was: What kind of learning environment in teacher education would push our students to take a stance and responsibility toward inclusive practices?

The focus was on a graduate course, *Working in Inclusive Practices* (WIP), taught at the School of Education, University of Iceland, at graduate level. The course was established in 1999 and through the methodology of self-study of teacher educational practice it has been under constant reconstruction. The course is grounded in a pedagogy that integrates professional knowledge about teaching, learning and child development, and involves an ethical and social commitment to all students. Through analyzing data from the course, we will discuss how professionals are enlightened and encouraged to realize their theoretical and pedagogical stance and be critical as they influence teaching, learning and reconstruction of inclusive practice.

Participants

There are six teachers teaching this course and two of them participate in this research. Hafdís, who created the course in the beginning and has led it since, and Edda, who has been an assistant teacher for a decade and will be leading the course next term. About 60 students attend the course each year and the group is always diverse. Some are in their initial teacher education, others are coming back for their graduate studies, some are pre-school teachers and others are compulsory or secondary level teachers. Some are distance students, while others take the course on campus. All students sign a consent form at the beginning of the course that we can use their tasks, *Tickets Out of Class* (TOCs) and comments. All names that appear in the findings are pseudonyms.

Data sources

The data in focus was collected in WIP for four academic terms (2017–2021). The course is 10ECTS and taught every fall term for 15 weeks. Data collection consisted of:

- Research journal. We write a journal about our teaching, collaboration, meetings, and thoughts. They are our personal accounts that we analyze individually and share with each other. We also communicate through e-mails and messages on Microsoft Teams. We collected those data sources for analysis and interpretation.
- Students' tasks. These were collected through the four years. Our students submit their tasks online, making these and their discussions available. Through the course students submit four main projects. The last task for students is to assess their learning with relevant arguments.
- TOC (ticket out of class). At the end of each class, students turn in a ticket where they reflect on what they learned that day and what they would like to focus on in the next course session. We keep all these tickets and analyze them after each class before we plan the next one.
- The course schedule, lesson plans and presentations were also part of the data source.

Data analysis

To ensure trustworthiness we analyzed the data individually and in partnership aiming for transparent and systematic data analysis (Wolcott, 2001). The methods for transforming the data into findings, and the linkages between data, findings, and collective interpretations provided explanatory and meaningful insights into our practice (LaBoskey, 2004). At the first stage of our systematic analysis, we read through all our data to locate the learning activities focused on inclusive education and/or professionalism.

We employed document analysis as we read through our data and made a list of these learning activities, looking for evidence of how we teach about inclusion and how we support our participants in order to enable them to teach and work with diverse groups of students. At the next stage we analyzed the work of participants, such as their projects, online discussions and TOCs, through the lens of inclusive education and professionalism. The third stage involved analysis of our personal journals. The final stage of the process focused on interpreting our collective analysis to gain an in-depth understanding and transparent view of how we support participants in creating inclusive practices.

Ethical issues

In the research project, we followed ethical standards for research, the Act on Personal Data Protection and the Processing of Personal Data (No. 90/2008) together with the University of Iceland's Code of Ethics (2014). From the outset of teaching the course, we have collected data on our teaching practice. To ensure that our research was ethically sound, we discussed the research plan with all participants at the beginning of each term and asked the willing participants to sign an informed consent form regarding our data collection. The anonymity of participants was ensured by giving them pseudonyms and de-identifying the data. All data have been kept in a secure place and only the authors have access to them.

Presentation of findings

The following article is organized into three sections based on the main themes. The first focuses on overall information about the course, the next focuses on how we work with the understanding of inclusion and inclusive practice and the third on professionalism and the professional working theory. The article ends with a summary.

The course: working in inclusive practices

Diverse groups of students in inclusive schools call for professional teachers who have a strong grasp of pedagogical competence and content, an understanding of child development and individual differences and who are devoted to the education of all their students. In this article we (the researchers) will introduce the WIP course as an example, the structure, and the tasks. We use quotes from the course material and participants' assignments to describe and illustrate our interpretation of our findings.

About the course

As we began to develop WIP, the aim was to prepare participants to draw on their resources in their work with diverse groups of students. Resources refer to individual talents and skills, knowledge and beliefs, experience, and culture. Participants bring valuable resources to the course and our intention is to draw upon these as we establish a learning environment that supports them in making meaning and acting.

The course is taught simultaneously on-line and on campus and the content is divided into four main themes as stated in the course syllabus: inclusion, professionalism and leadership, inclusive pedagogy, and collaboration. The themes relate theory and practice in inclusive educational settings, aiming at learning outcomes that give participants the competence to critically engage with issues and ideas inherent in learning and teaching in inclusive schools. This includes being able to design an educational environment, practice and pedagogy that considers students' diverse resources. Through this work and reflecting on their professional identity and beliefs the participants build their professional working theory (PWT).

The course methodology is centered on ideas from inclusive pedagogy and innovation education. Both build on social constructivist approaches, which are exemplified by reflection, collaborative discussions, and opportunities for students to develop new understandings and shape their learning. Innovation education focuses on creativity and knowledge in meeting needs or solving problems identified as important. The aim is to help people develop critical and creative thinking through dealing with every-day situations and gain capacity for action, using creative and critical problem solving. The core pedagogy builds on the ideas of learners as creative explorers and teachers as facilitators. Inclusive pedagogy emphasizes holistic and creative approaches to teaching practice, assessment, and collaboration within and around school. It begins with the learning of everybody and how the teacher can create rich learning opportunities available for all learners in the classroom to ensure their participation. It involves developing a system of offering equitable learning opportunities built on students' resources and the premises of universal access, active participation and belonging in school. Through the pedagogy of innovative and inclusive education, the goal is to facilitate the development of creative problem solving to enable participants to create learning spaces for diverse groups of students in inclusive schools.

The learning space created in the course is designed to provide participants with opportunities to reflect on their learning after each session through TOCs and by listing the teaching methods used. The TOCs are designed to give everyone a voice and a conscious participation in the course development. For each TOC, participants reply to the questions: What do you take with you from today's lesson? What do you want to know more about? Their replies are anonymous and here are examples of responses:

I learnt about teacher ethics in professional theory. Interesting.

I want to learn more about the ethical part of the PWT.

I learnt that my PWT is work in progress—one must remember that.

I want to learn more about collaboration between school and parents.

Our response is to adjust the next session, based on what was called for in the TOCs, either with increased emphasis on what was already discussed or with a change in focus.

At the end of each session, participants list the different teaching methods we employ. The list is compiled on the whiteboard and posted on Canvas. After one such session the list read:

- Group work
- Problem solving
- Think-Pair-Share
- Walk and Talk
- ...

The aim of the list is to give an overview of, as well as model, the pedagogy we use. Furthermore, our aim is for participants to practice identifying and discussing teaching methods.

One essential ingredient of the learning space created is the freedom participants are allowed in their assignments. The freedom involves stipulating in the assignment descriptions that creativity is encouraged, such as using prose, video, artwork, or some other innovative ways in their assignments. Many participants enjoyed the freedom and flexibility of the course. Stella stated she “really

enjoyed the creativity. I have not had the same opportunity to play like this and create in other courses.” For others the freedom meant that they were outside their comfort zone, as Sigrún phrased it: “Creativity is not something I would consider my strong side at all,” but agreed that it helped their learning.

While participants are encouraged to be creative, they must provide an argument for their work and link it to literature as needed. As an example, participants evaluate their participation and learning through a reflective self-assessment at the end of the course. This learning activity is a critical reflection on and evaluation of their work during the course and on what they take away with them from their participation in the various tasks and discussions. Rebekka wrote in her self-assessment:

For students to evaluate their own progress in the course and give themselves a grade is a good example of inclusive practice. I have never done this before and feel this is a great idea that challenges the student to look inward, at their moral values, independence, self-confidence and much more.

Participants are required to support their reflection with descriptive examples from their activities, such as excerpts from their study journal, examples from online discussions or critical moments in the course work. While we have found that the self-assessment is a practical tool for reflection that supports participants’ personal growth and professional development, many participants find it difficult to reflect on their own learning but are ready to evaluate our work instead.

Understanding inclusion and inclusive education

People have different understandings of inclusive education, what it is and what it calls for in practice. At the outset of the course, the participants are required to read selected texts and take part in an online discussion where they explore their understanding of inclusive education. This is done so we can analyze the understanding in the group—where they are at—so that we can begin working with them from that point. In that exercise, many express the opinion that inclusive education is a beautiful idea, but that it does not work in practice. Many participants agree that “the ideology behind inclusive education is beautiful and kind but the schools lack financing and resources to be able to work in that spirit” as Hulda, a student teacher, wrote in online class discussions.

Through a brainstorming exercise, the participants are asked to list the challenges of inclusive practice in schools. The list usually has issues such as lack of financing, professionals in schools, resources, and equipment, learning material and knowledge of disabilities. Participants also list the challenge of dividing attention and quality education between students with various abilities. In the words of Linda, “neither I nor other teachers can focus on one individual while we have 23 others that also need our assistance.” The aim is for participants to see how they can influence the challenges they listed, and through creative problem solving they look at their own contribution in creating inclusive practices. We organize a walk and talk, hang thirteen posters around the school building and arrange the participants into an equal number of groups. Each poster poses a challenge from the brainstorming exercise and participants use creative problem solving to come up with solutions to the challenge. The groups rotate through the thirteen questions, walk and talk, and at the end bring completed posters back to the whole group for sharing. While writing their solutions, they are asked to focus on issues within their own power to change, not on issues such as more money, resources or adding people into the schools.

Throughout the course participants write columns. In these columns they focus on their ideas, experiences or examples of practice supported by arguments and by referring to literature. There are four columns in all, each linked to the course themes: (1) theories of inclusive education and innovation education, (2) professionalism in teaching diverse groups of students, (3) inclusive teaching practices and pedagogy, and (4) collaboration in the inclusive school. For each column, the participants focus on the theme, reflect on their understanding and beliefs, experience and knowledge, and take a stance. The columns are posted online for others in the group to comment on and discuss. This process takes a week—from when the column is posted to when the discussions have ended. The aim of the task is to give everyone a chance to communicate their ideas and take part in an informed discussion with other participants. Everyone is given a space to have an opinion in a constructive conversation.

Participants write about various aspects of each theme and as Sigga wrote: “I admit that I was scared of writing the columns, but when I read the instructions and how I could use the writing to connect to my work I was unstoppable, and I wanted to write so much more.” Another participant, Jón, who is a school principal, realized that:

Reading other participants’ columns gave me an insight into the mindset of the teacher students who are in their first years of teaching, which is a good reminder for me that as a principal I am also “dealing with” diversity in my staff.

Here he is referring to the multiple viewpoints, beliefs and discussions that appeared in the columns as he acknowledged the difference in participant experience and backgrounds, which he can also expect in his staff.

In the assignment: Learning and Teaching Project, everyone chooses an issue related to the teaching of diverse groups of students, presenting and discussing it in a critical way. The project can be an individual project or a small piece of group work. Participants can focus on a specific teaching method, teaching methods, assignments, study materials, different pedagogical emphases, or other

topics/issues in connection with the teaching of diverse groups of students in inclusive schools. Examples of the assignments turned in are: Teaching deaf children how to read; Cooperative learning; Using multiple intelligence in the preschool; Icelandic saga: Njála for all.

Toward the end of the course, a transformation can be witnessed in participants' understanding of inclusive practice and pedagogy. Many state that their views and knowledge of the practical aspects of organizing inclusive schools have changed as they progressed through the course. Andri admitted that:

In my work I have been about to give up and sometimes wonder whether a student belongs in a traditional school system. After this course, my attitude is different and I believe it is possible to work with all individuals [...] but you need to be solution-oriented and open-minded.

Some also made connections to the importance of being aware of and working against prejudices visible in schools toward students who are different, have a foreign background or find it hard to fit into the system. Helga "wondered about the prejudice I have witnessed in teachers and other school staff and attitudes toward inclusive education. It is important to be vigilant toward these." Learning to meet the diverse needs of students is one of the greatest challenges of being a teacher. Participants have found that they have gained the "knowledge to design learning environments that build on and attend to students' resources" which is one of the central competence criteria for the WIP course.

Professionalism in teaching diverse groups of students

The course is based on the fundamental belief that awareness of professional identity is the core competence of teachers in inclusive practices. To create this awareness, we design tasks where participants take part in ongoing and critically reflective professional dialogs as they build their professional working theory (PWT). Guðný stated:

Since the beginning of the semester, I have had this project at the back of my mind. I have been wondering what kind of teacher I am, what kind of teacher I want to be, what I am doing well and what I could do better.

PWT is a living phenomenon rooted in practice, theory and ethics and is continuously evolving in the interplay between these aspects. The interplay means that the PWT is constantly being shaped as participants develop their understanding and are encouraged to reflect on how their life experiences affect their identities and professionalism and vice versa in the way professional knowledge, educational theories and practice influence beliefs and identity. Hermann wrote in his assignment that "In this project I have the opportunity to form an opinion of what kind of teacher I want to be and what expectations I have for the job." He expressed the thinking that the PWT has been in development throughout the course. PWT is explicitly developed through systematic and comprehensive critical reflection and dialog with colleagues as it contributes to the construction of professional identity, the creation of professional knowledge, and the transfer of collaborative approaches into practice. Participants are encouraged to use metaphors to explain their PWT and Hrefna compared her work with children to knitting:

... as I enjoy knitting just as much as working with children, I build on previous experience with new methods and solutions. Sometimes the methods I have been using do not work and then I have to go back (unstash) and try a new method that works better. The tasks can be demanding and then it is necessary to have a good dose of patience and resilience in order to be able to complete them. The joy of creation is often experienced with children, and it is always exciting to start a new project. The loops on the knitting needle are all the links that are related to the work and form the whole piece.

The PWT enables participants to systematically explore socio-cultural and historical influences on the practice of teaching. Like a braid, the PWT has three key strands: professional practice, educational theories or knowledge and ethics or moral principles. In the course, participants are asked to reflect on each strand to identify their professional identity:

- By looking at their practice, participants are provided with a space to explore their experience of their professional work and roles, including teaching, assessment, evaluation, collaboration with colleagues, and relationships with students and parents.
- By looking at theories the participants are provided with a space to reflect on their knowledge and the way they understand and relate practice to theory. This reflects teachers' theoretical framework and their explanations of what happens in the classroom as well as representing their method of relating self-understanding and reflective practice to theory.
- By looking at ethics, participants are provided with space to explain the reasons behind their practice and relate to their beliefs and values. This reflects what they are becoming, and what they want to be as teachers.

The course aim is to support participants to make their PWT explicit so they can continue to develop it for their future professional lives. The work takes time and calls for various methods and strategies. Therefore, allocated time to develop the PWT through discussions and tasks is organized throughout the course. Among the tasks are the Three Step Interview, column writing, poetic analysis, and core qualities, and we will introduce these shortly here.

The Three-Step Interview (a Participatory Interview) was originally designed to support participative, equitable and reflective approaches to life history interviews in a small group. Here this task is employed to provide participants with the space to explore the first strand: their professional practice. Participants, arranged in groups of three, are given three rotating roles of being an interviewer, interviewee and reflective note-taker and take turns in each role. For the Three Step Interview to be effective calls for good listening and interviewing skills, using open-ended and follow-up questions. In his TOC Fannar wrote: "The interview is a perfect way to begin analyzing one's own PWT, not only when I was interviewed but also in listening to the others being interviewed." Participants are encouraged to record the interviews on their phones so that they can revisit them for deeper reflection. The activity can be useful in working with students in teacher education because it provides opportunities to organize personal learning based on information from each student. It provides the opportunity for all to get to know each other on a deeper level and to get to know themselves, their strengths, and what they need to work on. Gunna stated that: "In my interview—I pleasantly surprised myself." For many, the interview is the first time they get a venue to openly reflect on and discuss their practice, how they think about it and what they value.

Writing the columns supports the participants in focusing their theoretical understanding and relating to their practice. The columns are the material for connecting and finding harmony between practice, theory and participants. They gain an insight into how theory can explain practice and be a rationale for practice. Ása wrote: "I used the columns to reflect on my practice and since I have very limited teaching experience, I enjoyed reading the other participants' responses, viewpoints and stances on my writing." Meeting the purpose of writing the columns, the participants took different learning paths, as Reynir put it:

I used them to take a closer look at certain aspects, innovation, inclusive education, professionalism and what professionalism in work really is and how it can be increased and maintained in terms of important cooperation and collaborative school and school communities.

In connection with the column writing, we also used the method "Poetic analysis." Poetic analysis can be defined as a method that creatively constructs text into expressive and artful representations. The purpose of using this method is to support participants in looking creatively at issues from different viewpoints and to identify the core meaning of their writing. Anna stated: "This method has completely crept under my skin, so to speak." She decided to use this method to express her PWT as she summarized her thoughts and ideas. So, the poetic analysis can be seen as both being used to analyze meaning and to bring together participants' ideas and theories. Her poem from her PWT follows (the first verse in our translation):

Positive leader, determined but fair

We learn and play inside.

For all it is best to learn and participate,

The young learn best through play and games.

Summarizing the columns is the foundation for the theoretical framework that they build their practice on. The summary is then braided into the PWT as one of the key factors of the PWT braid.

The final strand of the PWT braid are the ethics and to begin with it looks like this is more challenging for participants than reflecting on their practice. Through teaching the course, we have developed ways to work with this challenging factor. As a starting point participants explore their own core qualities. Core qualities are individual strengths, what they are good at or what others praise them for. Using Think-pair-share to support the participants to reflect on their core qualities, they are given a list of 39 descriptive words. During the "think" part of the activity they select five words from the list, then in small groups they introduce their core qualities and give feedback to each other (pair). The activity ends by everyone reporting to the larger group (share). Participants usually enjoy this task as it allows them to focus on their own qualities and how they affect people and to keep them in mind when it comes to working with others. They often state that this task opens their eyes to issues that one does not usually think about. As Heiða stated: "Finally it is all right to acknowledge your qualities and be who you are in your teaching."

The final PWT projects are submitted in various forms. Helgi stated that "I could express my thoughts and ideas not only in writing but also in artistic ways—my strength is creativity." By means of the PWT project participants are given the chance to reflect on their values, ethics and professionalism, and Mary admitted "I had not realized before that I build on certain values or ethics in my teaching." By creating a capacity in teacher education for student teachers and teachers to reflect on their professional identity and define themselves as teachers, they can develop an understanding of their teacher professional agency and how it influences their work and allows them to take a stance.

In the findings, we have introduced the course and examined two main themes: inclusive pedagogy, and the professionalism of teachers. We have compiled, analyzed, and interpreted data to show how we have designed a course that aims to enlighten professionals as they form their theoretical and pedagogical stance and create inclusive practice for all students.

Discussions

The purpose of this self-study of teacher education practice was to untangle how we as teacher educators respond to the call for preparing teachers to work in inclusive practices. Our intention was to explore one course, WIP, and analyze critical issues in the preparation of student teachers. Thus, we will discuss the learning environment we created in the teacher education at graduate level to push our students to take a stance and become responsible toward inclusive practices.

In our theoretical framework, we explored the challenge of teaching student teachers to teach and the complex interplay between students and teachers, and students and subjects (Hordvik et al., 2020; Loughran, 2013). Teaching people to become teachers is not straightforward (Loughran, 2013) and to become a responsive teacher in inclusive settings is even more complicated because people do not necessarily refer to their own experience of diverse classrooms. Our student group is diverse according to teaching experience and age, teaching level and subjects, cultural and language background and we need to respond to these differences. Our teaching team is also diverse, and every team member contributes a valuable resource of knowledge and experience (Loughran, 2013). Behind our thinking as we develop and teach the WIP course is to “walk the talk,” be inclusive, creative problem solvers and build our teaching on students’ resources. However, it can be demanding to create a learning environment of trust, collaboration and problem solving in one term. Reconstructing thinking, beliefs and learning takes time (Dalmau and Guðjónsdóttir, 2017) and we suggest that all courses in the teacher education program should consider inclusive pedagogy as a foundation for practice. In feedback from the majority of participants through the years, we see are that they are comfortable with the learning spaces created. Nevertheless, it often takes them time to get used to the freedom, find the courage to step out of their “box” and approach tasks and projects in creative ways. It can be challenging, both for participants and teacher educators, to move out of the comfort zone, risk uncertainty and explore new ways of planning, teaching, and learning (Guðjónsdóttir and Óskarsdóttir, 2020). We believe, however, that this is the basis for creating a responsive and inclusive learning environment.

Through the years, many participants have attended the course in the assumption that inclusive education is a beautiful idea that does not work in practice. Participants build their beliefs on the dominant discourse in society, in schools and among other professionals and parents (Óskarsdóttir, 2014). Many teachers and administrators also report that their initial education or ongoing professional development has not prepared them for inclusive practices (European Agency for Special Needs and Inclusive Education, 2017), and others call for more knowledge on different disabilities, learning difficulties, behavior problems or how to work with students with diverse cultural backgrounds or languages (Óskarsdóttir, 2014). The participants in the course also point out that there is lack of finance, support personnel and paraprofessionals and that teachers do not know how to teach students with diverse needs. We have grasped the need to bring this discourse on inclusion to a new level—or out of the deficit discourse that leads to pessimism. For that purpose, we have worked with participants on different tasks that gradually move them to view inclusive education from a different angle and understand their responsibility in implementing it. Introducing the methods of innovation education to the course has been instrumental in moving this thinking forward. Identifying barriers to participation and employing creative problem solving has shown participants how they can plan inclusive learning environments for all learners (European Agency for Special Needs and Inclusive Education, 2015). According to our data, it is clear that through the course participants transform their thinking about inclusive pedagogy and professionalism. They approach inclusive education as a task for them to solve and not something that others have to solve for them, thereby conveying that they are willing to take a stance and let it guide their decisions and practice.

Teachers play a key role in responding to the call for schools based on inclusion and need to see themselves as agents of change (UNESCO, 2020). This is achieved as teachers recognize their professional and personal resources, become aware of their professional identity, rationalize their practice with educational theories and acknowledge the moral principles that affect their practice (Barni et al., 2019; Eteläpelto et al., 2013; Sachs, 2001). We introduced the PWT, a living phenomenon rooted in practice, theory and ethics, as a framework for participants to identify their professional identity. Thus, by beginning to critically reflect on their practice and then relate it to educational theories and their ethics, the participants develop their professional agency (Biesta et al., 2015).

Our interpretation of the findings is that the pathway from the beginning to end of the course is not linear. In our learning environment multiple paths can be taken based on the needs, interests, and resources participants bring to the course or choose to reach their destination. As student teachers travel along these diverse pathways, they are supported to become critical and creative problem solvers and be aware of their professional identity. Their chosen pathways support them in exploring how they can influence teaching and learning and become involved in the reconstruction in Iceland of inclusive practice which offers rich learning opportunities available to all learners (Black-Hawkins, 2017).

Introduction

Historically, science curricula around the world have emphasized the learning of science content knowledge. Science teaching often positions students as receivers of “final forms of scientific knowledge” (Duschl, 1990) without engaging learners in how such knowledge has been generated and why this knowledge is credible. For example, how do we know that matter is made of tiny, indivisible particles? Why do we believe that the planet earth rotates around the sun? Delivering unquestionable “facts” to students without engaging them in evidence-based reasoning is essentially akin to dogma, and as such, is far from the scientific worldview that values reason and evidence. The aspects of science that emphasize knowledge production processes are related to what is often considered as “epistemic practices” of science.

Epistemic practices thus defined relate to those activities that help mediate the development of scientific knowledge which is characterized by theories, models and laws (Erduran and Dagher, 2014). They can include processes such as modeling and argumentation. Argumentation can be defined as the justification knowledge claims with evidence (Driver et al., 2000; Erduran and Jiménez-Aleixandre, 2007; Jimenez-Aleixandre et al., 2006) and includes variety of discursive practices such as “*assessing alternatives, weighing evidence, interpreting texts, and evaluating the potential viability of scientific claims*” (Driver et al., 2000, p. 288). Models, on the other hand, are forms of knowledge that can be defined as an abstract representation of reality and can be “*an idea, object, event, process, or system*” (Justi and Gilbert, 2000, p. 994). Modeling involves a range of practices including data aggregation and representation. All forms of scientific knowledge essentially provide explanations to account for how and why particular natural and physical phenomena occur (Chinn and Brown, 2000; Nagel, 1961).

Although historically, epistemic practices of science have been neglected in science curricula, more recent curriculum standards document have included references to the significance of learning epistemic aspects of science. Consider, for instance, the Framework for K-12 Science Education developed by the National Research Council (NRC, 2012) of National Academy of Sciences designed in order to create standards of science education. The Framework is based on evidence-based findings of current research and introduced three major dimensions of science education. Scientific practices were recommended as one of them and defined as “(a) the major practices that scientists employ as they investigate and build models and theories about the world” (NRC, 2012, p. 30). National Research Council (NRC, 2012) specified eight practices that propose the necessary components of science curriculum. These are:

- Asking questions (for science) and defining problems (for engineering);
- Developing and using models;
- Planning and carrying out investigations;
- Analyzing and interpreting data;
- Using mathematics and computational thinking;
- Constructing explanations (for science) and designing solutions (for engineering);
- Engaging in argument from evidence;
- Obtaining, evaluating, and communicating information (p. 49).

Although advancement in curriculum reform have thus advanced epistemic practices as learning outcomes, it is not entirely clear how teachers may teach epistemic practices in their lessons. Curriculum revision by itself may not be enough for ensuring that students are taught for understanding and experiencing of epistemic practices. Teachers as the major actors of learning environment should also have an understanding of epistemic practices. Considering most teachers' own learning experiences would have preceded such recent reform initiatives, the question remains as to how teachers can be supported in their learning to teach epistemic practices of science.

The purpose of this article is thus to explore how teachers' learning of epistemic practices of science can be supported. The particular focus will be on argumentation in science as an epistemic practice. Following a review of the literature on epistemic practices including examples of argumentation, modeling and explanations, we will thus focus on teachers' learning of argumentation. An important element of teachers' understanding of argumentation *in science* as an epistemic practice involves how they might potentially distinguish it from argumentation in other subject domains. In other words, given a broad set of subjects can be considered from an argumentation perspective (e.g., religious education, history, English), what differentiates argumentation as an epistemic practice of science? We will address this question by contrasting how argumentation is framed broadly in epistemic practices of two contrasting school subjects: science and religious education. Following this theoretical account, we will then draw on some empirical data from a funded project based in England to illustrate how in-service science teachers view argumentation and engage in its teaching.

Epistemic practices in science education

Epistemic practices in science could involve a range of knowledge production and evaluation processes such as coordination of theory and evidence; and making sense of patterns in data (Kelly and Licona, 2018). Epistemic practices in science education refer to those cognitive and discursive activities that engage learners in the knowledge construction processes of science. Teachers and students may have their own personal epistemologies related to a range of subjects as well (Hofer, 2001). Conventionally in school science, students' engagement in epistemic practices of science and in argumentation in particular has been scarce, and science teachers' own background in learning to teach epistemic practices tends to be fairly limited (Kelly and Licona, 2018). Despite years of reform across the world to improve science teaching and learning, the epistemic aspects of science teaching and learning continue to be of concern to many science education researchers (e.g., Chinn and Maltotra, 2002; Jimenez-Aleixandre et al., 2006; Sandoval and Reiser, 2004).

Apart from an explicit focus on epistemic practice, several other lines of research in science education are concerned with epistemic practices of science. These include argumentation (Erduran et al., 2019), modeling (Justi and Gilbert, 2000) and explanations (Chinn and Brown, 2000). Argumentation can be defined as the justification knowledge claims with evidence (Jimenez-Aleixandre et al., 2006) and includes variety of discursive practices such as "*assessing alternatives, weighing evidence, interpreting texts, and evaluating the potential viability of scientific claims*" (Driver et al., 2000, p. 288).

Models and modeling literature in science education led to substantial amount of insight into how learners construct knowledge representations. Models are forms of knowledge that can be defined as an abstract representation of reality and can be "*an idea, object, event, process, or system*" (Justi and Gilbert, 2000, p. 994). Modeling enables an unknown reality (target) to be explained with a more familiar reality (source) (Duit and Glynn, 1996). By focusing on specific aspects of a phenomenon, models simplify the phenomenon (Duschl and Erduran, 1996; Ingham and Gilbert, 1991). Different forms of knowledge such as models offer explanations which describe how and why something happens (Chinn and Brown, 2000). Typically, scientists explain phenomena by determining how and why they occur along with the conditions surrounding the observed events (Nagel, 1961). Explanations can be articulated relative to disciplinary conceptual frameworks (Dagher and Erduran, 2014) highlighting variations in how explanations are defined in different fields of science such as biology and chemistry.

Apart from their epistemic dimensions, lines of research on argumentation, modeling and explanations may involve other aspects as well. For instance, argumentation is not only an epistemic practice but also it can be framed from a linguistic and social perspective, which underpin the work of many science educators working on argumentation (Erduran et al., 2015). In our previous work, we have thus developed a heuristic based on a review of literature on philosophy of science (Erduran and Dagher, 2014) that consolidates the cognitive, epistemic and social aspects of practices in science. The heuristic called the Benzene Ring Heuristics (BRH) includes epistemic components such as scientific activities, data, model, explanation and prediction (see Fig. 1). Cognitive and social components respectively refer to representations and reasoning and social dissemination and certification of scientific claims.

Fig. 1 "Benzene Ring" heuristic of scientific practices. From Erduran and Dagher (2014, p. 82).

BRH suggests that all features of scientific practices are related to each other and these relationships do not have a linear order. In other words, holistic understanding of scientific practices was emphasized with the representation referring to an analogy that is Benzene Ring. In this heuristic, components of scientific practices such as modeling are related to the social components (representation, reasoning, discourse, social certification) in a dynamic and interactive manner. The heuristic emphasizes modeling of data generated through a set of activities such as experimentation, observation and classification. Modeling serves to explain and predict the phenomena under investigation.

The models help explain different scientific concepts. For example, the atomic model can help explain concepts such as electrons, protons and neutrons. Furthermore, it illustrates the connections between these concepts. In the example of the atomic model, the Bohr model of the atom can help predict chemical bonding between different atoms and explain chemical properties. Argumentation is a mediating process that interlinks the epistemic and cognitive aspects of science such as prediction and explanation. For example, atomic structures yielding different molecular combinations can be argued about. Various stages of modeling, predicting and explaining can involve argumentation or the justification with evidence of the claims being made.

Teachers' epistemologies and epistemic practices of science

Incorporating frameworks such as the Benzene Ring Heuristic (see Fig. 1) in science teaching and learning requires that teachers are familiar not only with the underlying concepts such as models and explanations but also the epistemic practices through which these concepts are generated, revised and evaluated. In other words, there are demands on teachers to interpret and teach epistemic practices of science. However, teachers themselves bring with them to the science lessons their own personal epistemologies. Arguments for the importance of teachers' understanding of the epistemic dimensions of their subject are not new. Almost half a century ago, Schwab (1962) had argued that expertise in teaching requires both knowledge of content of a domain and knowledge about the epistemology of that domain. Teachers develop the necessary capability of transforming subject into teachable content only when they know how the disciplinary knowledge is structured (Erduran and Kaya, 2019). For example, a chemistry teacher who understands why and how models contribute to chemical knowledge will be better able to facilitate students' understanding of the role of models in chemistry.

Such understandings are often referred to in educational psychology and science education as *personal epistemologies* or *epistemic beliefs* (Hofer, 2016). There are many other terms, but in most instances the core idea refers to a set of beliefs about the nature of knowledge and nature of knowing. For example, Hofer (2000) refers to these beliefs as consisting of a set of beliefs about the certainty of knowledge (whether knowledge is fixed and stable or tentative and evolving over time), simplicity of knowledge (whether knowledge is an accumulation of isolated facts or an interconnected web), justification for knowing (beliefs about how we come to know and justificatory standards for saying we know something) and source of knowledge (whether we source knowledge from the testimony of others such as experts or from within through perception, reasoning, memory, etc.).

Significant effort has gone into researching the current landscape of teachers' epistemic beliefs, their development by natural means and through intervention, and their implications for teacher education. There are at least 3 ways to consider the influence of epistemic beliefs and personal epistemologies on teaching and learning. These are the influences on (1) students' learning (2) teachers' learning and (3) teachers' teaching. There is currently sufficient evidence in the research literature to consider epistemic beliefs to be particularly worthy of attention in teacher education. In a synthesis of the literature on personal epistemology in learning mathematics, Muis (2004) found that all 33 studies in the review demonstrated significant relationships between personal epistemology and other relevant factors to teaching and learning, such as motivation and academic achievement. This resonates with findings that epistemic beliefs can be influential for one's own strategies toward learning (Windschitl and Andre, 1998; Ravindran et al., 2005; Bondy et al., 2007; Bromme et al., 2008), critical thinking (Bråten and Strømsø, 2006), motivation (Beghetto and Baxter, 2012), metacognition (Yenice, 2015), views on the Nature of Science (Yenice, 2015), and sense of self-competence (Di Martino and Zan, 2011; Roesken et al., 2011).

Teachers' epistemic beliefs have been associated with their understanding of effective pedagogy (Yadav and Koehler, 2007), their own self-efficacy in teaching (Chrysostomou and Philippou, 2010), their own learning strategies (Peng and Fitzgerald, 2006), and their support of student autonomy (Weinstock and Roth, 2011). These beliefs can also mediate how those who are learning to teach judge their own success in their teaching. Yilmaz-Tuzun and Topcu (2008) found, for example, that pre-service science teachers felt successful in their science teaching when students memorized facts, if they held an epistemic belief that scientific knowledge is an accumulation of unchanging facts. Furthermore, epistemic beliefs have been found to be influential for a teacher's conception of teaching and learning (Wong et al., 2009; Yilmaz and Şahin, 2011), their preference in teaching practices (Windschitl et al., 2008; Chai and Khine, 2008; Çetin-Dindar et al., 2014) and their actual teaching practices (Kang, 2008).

Despite the rather extensive quantities of research that ultimately support Schwab's (1962) argument that expertise in teaching requires both knowledge of content of a domain and knowledge about the epistemology of that domain, it is often found that teachers may have underdeveloped epistemic beliefs in their subject domain (e.g., Kang and Wallace, 2005; Kang, 2008; Liu and Tsai, 2008; Markic and Eilks, 2012; Topcu, 2013). In such a context, the question for teacher education is how to support the development of epistemic beliefs in pre-service and in-service teachers. The field has generated research on this topic too—focusing both on understanding the natural development of trainee teachers during their initial teacher education and the influence of interventions for epistemological development. Walker et al. (2012), reporting a longitudinal study of epistemological development in

teacher education, noted a number of factors that appeared to “play a role” in development. For example, teaching experience on school placement, increasing subject knowledge, engaging in reflective practice, and encountering contradictions in theory or opinion in their initial teacher education (ITE) program. Guilfoyle (2018), in another longitudinal study, pointed to the research project component of the ITE program as having potential for epistemological development within the discipline being researched. Group discussions and explicit written reflection on one’s own epistemic beliefs may also be helpful in developing epistemic beliefs (Brownlee et al., 2001; Baxter Magolda, 2002), particularly those including comparison of multiple perspectives (Marra and Palmer, 2011). Such pedagogical interventions are most effective, it is suggested, where PSTs can “defend their opinions in response to counter-opinions ... [and] consider counter-claims” (Topcu, 2011, p. 117). Related to this, Iordanou et al. (2016) suggest that epistemic beliefs develop “in sync” with argumentative reasoning and so argumentation activities may aid in the development of epistemic understanding (Iordanou, 2010). Modeling intervention activities, too, have been associated with the development of epistemological development in science teacher education (Windschitl et al., 2008). We focus our attention more closely on these two elements, argumentation and modeling, to draw out more specific implications for teacher education and the relation with learning to teach epistemic practices in secondary science classrooms.

Argumentation as an epistemic practice: teaching in different domains of knowledge

Nature of argumentation in science versus other domains

It has long been recognized that argumentation can have features that are similar across a range of fields, domains or disciplines (field-invariant) and features that are specific to the arguments of particular fields (field-dependent) (Toulmin, 1958). For instance, a field invariant feature may be a structure involving the coordination of information (facts, concepts, principles, etc) to create claims that are supported by evidence, where the relevance of the evidence to the claim is established by means of a warrant. But field-dependence may emerge in differences in the nature of the claims, evidence, and warrants that are deemed appropriate for a particular disciplinary context and these represent important epistemological principles for that discipline. We introduced argumentation, above, with respect to science specifically. Now, we will explore how the nature of argumentation in science compares with the nature of argumentation in other domains in the secondary school context.

Goldman et al. (2016, 2018), as part of a wider framework for disciplinary literacy, compared the epistemology, argumentation, and inquiry practices across three disciplines (i.e., science, history and literature). Their theoretical work serves as a useful tool for our current purpose. They tease apart the similarities and differences between these domains by looking for distinctions in common features. For example, while each domain is concerned with advancing claims of some sort, the nature of these claims often distinguishes them. In the claims advanced in study of literature are about personal relevance, structure, rhetoric, theme, and connections to historical, political, ideological, or theoretical positionings.

The evidence drawn upon will be segments of text as representations or illustrations of patterns, messages, structures, etc. The warrants may be rooted in personal beliefs, life experiences, theory, or philosophical tenets. In the study of history, the claims that are advanced are interpretations of the past based on available evidence of the historical record. They draw on primary sources such as documents like diaries, letters, census data, government documents, maps, photographs, video or other physical artifacts. Evidence may in some instances come from secondary or tertiary sources too. There is an acknowledge of the perspective of these sources or the that the historical record may in many cases be incomplete. Historians can use a range of interpretative frameworks in warranting their arguments. For example, they can generate interpretations in terms of societal systems, government systems, relations between phenomena (e.g., cause-and-effect or chance), or particular themes (e.g., industrialization, migration, etc).

In all instances the interpretation must account for all the remnants of history. That is to say, one cannot ignore a piece documentary evidence in advancing an argument because it does not fit. In science, claims are generally about the nature and operation of phenomena in the natural world. These claims may be in the form of explanations, theories, laws, models, or predictions about these phenomena or the relationships between phenomena. Evidence is generally that which can be gathered or generated through reliable processes that can be corroborated. Evidence is represented in a variety of forms, including but not limited to tables, graphs, equations, diagrams, models, simulations and written narratives. Warrants are provided through principles that are enduring in the field.

Religious Education (RE), as a school subject, provides some interesting scope for developing an understanding of epistemic practices across a range of disciplines as they are view in together or in comparison. RE in England, as in other jurisdictions globally, is a multi-disciplinary study of religions, beliefs, and worldviews (Fancourt, 2015). It is generally conceived as being pluralistic with the ambition to foster tolerance, understanding, respect for varying religious beliefs and none (Jackson, 2004). Studying religions and worldviews like this will naturally draw on philosophy, history, sociology, psychology, and other cognate disciplines (Freathy and John, 2019). Natural science also features in RE both in terms being considered a “worldview” (the scientific worldview) but also how science has something to say about some of the claims made by religions like, for example, creation. This “melting pot” of disciplinary perspectives provides a rather rare opportunity to emphasize disciplinary differences in epistemic practices. Though, if learning to teach one subject area of substantive and syntactic knowledge (Schwab, 1962) weren’t enough, a practitioner would need to understand the syntactic knowledge of these each of these cognate disciplines in order to facilitate students’ development of these epistemic understandings. This is where the strength of a collaborative approach can come to the fore. Next, we will discuss a funded project in the University of Oxford, which brings together both science and RE teachers from the same schools to focus on interdisciplinary and cross-curricular collaboration for the teaching and learning of argumentation.

OARS project: argumentation in different school subjects

The Oxford Argumentation in Religion and Science (OARS) project is a three-year research and development project funded by the Templeton World Charity Foundation's Big Questions in Classrooms initiative (Chan and Erduran, 2022; Chan et al., 2020; Erduran et al., 2020; Erduran et al., 2019; Godfrey and Erduran, 2022; Guilfoyle and Erduran, 2021; Guilfoyle et al., 2021). The OARS project brings together teachers and researchers from science and RE to focus on the teaching and learning of argumentation within and across these subjects. A Continuous Professional Development (CPD) program, consisting of six workshops, was organized by researchers and teacher educators at the Department of Education, University of Oxford. Pairs of science and RE teachers were invited from schools within a reasonable distance of the University to attend this program of evening sessions to think, talk, and learn about argumentation in their own subjects and in the "other" subject.

The CPD focused on supporting students in learning how to make complex judgments in science, religious education and, importantly, in the issues where these subjects may overlap (Erduran, 2020). For example, in discussing the origins of the universe and life, or whether or not genes should be cloned. Such skills are important for achieving curriculum goals in both subjects (Chan et al., 2020; Erduran et al., 2019) but also for nurturing children as future citizens with the capacity to have productive conversations across divides of opinion and discipline. In sessions, we recognize the distributed expertise (Childs et al., 2014) where each individual in attendance is bringing worthwhile expertise to the collective learning. Of the 30 teachers who were participating, many were highly experienced practitioners, and some had a Ph.D. in their content area. As such, participating teachers were often in a position to significantly contribute to their peers' learning within and outside their subject area, and within and outside their school contexts. This was a key advantage of the collaborative process of the CPD project. A natural in-school peer community was created by virtue of the fact that teachers were coming to the project as pairs, or sometimes small groups, from their school, and coming together during CPD sessions to form a wider community with other schools (Vangrieken et al., 2017). In the next section, we will draw on qualitative data from interviews with OARS project teachers to highlight the teachers' views of argumentation and some of their expectations of engaging in collaborative work between teachers of science and RE. These serve to illustrate some of the potential of engaging in this work and raise some questions about the challenges involved in teachers' learning to teach epistemic practices.

Science versus RE teachers' views of argumentation

The collaborative element of the OARS project opens conversations between RE teachers and science teachers. Not each expression by the teachers' is necessarily true or accurate, particularly as they characterize the "other" subject, but these characterizations could often lead to challenge by other teachers. This process, ultimately a discursive argumentation exercise with the common goal of ascertaining the nature of argumentation for their subjects, drew out a deeper thinking about epistemic practices and criteria. Take, for example, the following quote.

I think listening to the RE teachers at the sessions, we were, you know, trying to **pin each other down on what we mean by evidence**. And, of course, coming from a scientific perspective, having to sort of broaden that out into things that could include doctrines and life experience and stuff like that.

School B—Science.

Here we see a science teacher reflecting on their scientific perspective on evidence because of an interaction with RE teachers about what counts as evidence for arguments in their subject. There is not yet a conclusion here, but it raises questions in their mind about what other disciplines consider acceptable evidence. Such thoughts about the epistemic criteria in science might not otherwise be elucidated but for the conversations with RE teachers. It alerts the science teacher, at least, to the fact that students are exposed to arguments with different justificatory standards in other areas of the curriculum. The notion of "evidence" is not unique to science. Instead, this teacher feels the need to "broaden that out", and instead think about the standards of acceptability of evidence.

When talking about how argumentation features within their classes, some RE teachers highlight how they need to engage with epistemic criteria about what counts for evidence for knowing (addressing Hofer's justification and source dimensions of epistemic beliefs).

I was talking with one group last week about life after death. And one of them said, "but there's no evidence!". And then we looked at sort of personal experiences, and they went, "well, that's not evidence". And it's **that what will you and won't you accept as evidence** and personal experience ... I said, "Well, if I came in tomorrow, and told you something, what would you say?" And they sort of laughed at me and said, "We probably think you had too much wine".

School B—RE.

It is worth noting that even though RE teachers discuss and recognize the wider forms of evidence invoked in arguments of the cognate disciplines or of religious individuals, they often held aspirations that their students' arguments within their subject would be strongly substantiated.

Our pupils choose evidence that's quite woolly. They will often prefer to describe beliefs, which they think they can describe more freely than facts. I think that if our pupils were more factual within the describing language that would be an improvement for argument.

School F—RE.

But RE teachers emphasized that while there is differing evidence acceptable within their subject, it is not solely evidence that is the marker of a quality argument, but also the development and structure of the argument.

There's differences in the type of evidence you use. So for instance, if you're having an ethical argument, you are **not relying on necessarily on proven fact**, and researched information, you're **relying on logical development** in arguments. Whereas there perhaps isn't an opportunity within science Similarly, in RE, there's opportunities for using I would say "proper" evidence. But I think it's weighted much more heavily on one than the other. I guess.

School C—RE.

This sort of focus on the structure and development of arguments in the form of warranting (i.e., establishing the link between evidence and claim) was something that some science teachers felt was lacking in their subject when they compared it to RE.

So it's just the argumentation is actually very different. It's sort of "here's the evidence". Well, there you go, then. It's sort of ... there's not [in RE teacher]'s terms, there's not much in terms of the warrant. In other words, how well does the evidence relate to the claim? That's not well taught in science. It is pretty much: "Here's the claim and here's the evidence that shows it QED".

School R—Science.

Some science teachers wondered if the sorts of arguments they engaged in within science really "counted" as arguments at all, as they felt there was a lack of a controversial nature to the claims involved and that there exists a correct, verifiable answer.

So I was saying earlier, so we think substance A is ionic, because it's got a high melting point, because it conducts when it's in solution. So the idea of giving reasons, from experimental evidence for saying the thing you're saying. So we have quite a lot of opportunity for that. But that doesn't feel to me, like really, what we're talking about here in terms of framing an argument.

School C—Science.

This idea that arguments in science, or at least school science, are "unwarranted" seems to relate to the ideas about the accessibility or complexity of scientific knowledge for this age group. There is a sense that science needs to be simplified to be understood, and there for it needs to be accepted ("source" beliefs, Hofer, 2000) with little provision of the link between claim and evidence (justification beliefs).

So, there might be, you know, a page in the textbook on different views of the atom and how that's changed over time. But yeah, right now, it's pretty much as much as you get. Whereas some quite important things are based on some quite complex arguments, currently. And it is simplified to be understandable, but you lose that sense of the link between evidence and why you believe things.

School R—Science.

This view of school science can lead to an epistemic message that science is effectively an accumulation of knowledge (simplicity beliefs) that is unquestionable (certainty beliefs) and is received from authority (source beliefs).

Science deals with facts, and it's really the regurgitation of those facts in a kind of simple formula. And that's what science is until you are at University, probably beyond your undergraduate. You're basically learning the kind of bedrock of stuff.

School M—RE.

However, this idea seems to run counter to beliefs of teachers about what school, and the teaching and learning of argumentation, ought to achieve. The following pair of teachers from School C were in agreement that emphasizing the skills of argumentation in class was about getting students to understand what was necessary to warrant a claim and to be able to assess the presence or absence of an appropriate warrant for the claims they were faced with in life. While this is clearly about the justification of knowledge, it also underscores beliefs about the source of knowledge in not blindly receiving knowledge from an authority source but building a capacity to self-assess arguments.

I would have to say “Is this a logically ...” ... Does that evidence actually backup that claim? Because we get a lot of claims ... And that’s a really valuable thing, I think, for students to take away from their education, because then they’re presented with a vast number of claims, and mostly through social media, there’s a huge number of completely invalid claims. Supposedly, with evidence and yet it doesn’t back it up.

School C—Science.

And being able to see that the evidence that is being quoted is irrelevant to the claim that is being made ... that skill of spotting it, I think, is a skill. I think for a lot of people they are just kind of nodding when they hear things.

School C—RE.

This is echoed by other science teachers who say that “*it’s one of the main reasons I want students to learn science*” to “*hopefully provide them with skills to not take everything for granted*” (School G—Science). There is a real sense of wanting to develop some general epistemic beliefs about the source of knowledge being more nuanced than just from authority (“*scrutinize the conclusion that being presented to you ... in the era of fake news and spurious arguments, made by politicians*”, School L—Science). But given the tension of simplification, science may struggle to do this (“*I don’t think we’re very successful to do it*”, School L—Science).

So [there] does come a point where we just have to trust arguments or information to some extent, if you’re not an expert in that particular topic area, and how does one make a judgment about that, I suppose.

School N—Science.

Science teachers at times seemed surprised to note from RE teachers just how much justification and argumentation processes occurred in RE classrooms (“*There’s a lot more of that in your subject [to RE teacher]. Than I had realized*”, School A—Science). RE teachers often echoed many of the same goals for their students in terms of learning critical thinking skills to dissect the arguments that they encounter in their lives, beyond the content area of the subject. There is a real sense from the teachers that they are working to the same ends:

Being able to read something, or to listen to something and then to be able to express their ... and uncover the hidden assumptions in the line of argument, whether that was a bit of fallacious reasoning or something like that. That’s ultimately taking the skills base that we work on. And not restricting it just to what we think about [in the subject] but to other things as well. Take it to the real world.

School L—RE.

These quotes provide an illustration of the early stage conversations and thoughts that occurred in the collaboration process. There are numerous rather promising indications in these early remarks. First, is that the collaboration between teachers seemed to open up a dialog (through and about argumentation) that promoted thinking and reflection on their own epistemic beliefs of their subject area. This is done in the context of teaching and learning of students, so it becomes directly applicable to their teaching of the syntactic knowledge of their subject or discipline. Secondly, these teachers began to gain an understanding of each other’s subject areas. Strengthening this understanding means that teachers are more aware of what their students experience in others subjects and what arguments or forms of evidence they are exposed to. This understanding could be capitalized upon to make clearer the similarities and differences between subjects. Finally, teachers uncovered common underlying goals for students to be critical thinking citizens who can manage in a “post-truth” world surrounded by “fake news”. This can highlight the benefit of working together to achieve these goals. In fact, in doing so, students may have a more nuanced capacity to deal with problems in the real world if they have the ability to discern the arguments of different disciplines apart in multi- or inter-disciplinary contexts. Cross-curricular work can then have the potential to strengthen multi- and inter-disciplinary thinking.

Conclusions and implications

The article provided an overview of some key epistemic practices of science including modeling and argumentation. Following a review of literature on teachers’ own personal epistemologies, we presented data from a funded research project that aimed to incorporate argumentation in science and religious education teachers’ lessons. The data illustrated that teachers of both subjects value argumentation as a component of their subject. Furthermore, they were keen to exchange professional experiences and knowledge with teachers of the other subject. Engagement in collaborative dialog can expose teachers to how argumentation may be situated in not only their own subject but also in a different school subject, potentially resulting, through a comparative analysis, in a deeper understanding of the epistemic practices of their own subject including its particularities. Teachers’ engagement in other epistemic practices such as modeling across school subjects may also provide fruitful in fostering understanding of nuances of disciplinary characteristics of knowledge.

Although some epistemic practices such as argumentation may provide points of conjecture between different school subjects, there may also be fundamentally different components to the epistemology of the subject. For instance, how data and modeling are used in science may not necessarily apply in a subject such as RE. Further studies are needed to elaborate on how subject epistemologies might compare across a whole range of aspects. Theoretical accounts on comparative analyses of subject epistemologies can help clarify what epistemic practices can be prioritized in teachers' learning. Even within a particular school subject such as science, there may be domain-specific ways of thinking and reasoning. Consider, for example a contrast of epistemological features of biology and chemistry. When the types of explanation in chemistry and biology are contrasted, the result is a diversity of types that are distinctive to the science in question (Dagher and Erduran, 2014). While biological explanations include viability and developmental explanations that draw closely from the nature of biological content, chemical explanations focus on the structural and representational explanations that are based on either quantum mechanical or simple chemical models. The context of debates around the nature of biological and chemical laws and explanations are also rather particular. Whereas reference to principles is common in biologists' discussions of laws, the chemists are preoccupied with questions regarding axiomatization and approximation (Dagher and Erduran, 2014).

Finally, there are implications for not only continuous professional development programmes of science teachers and pre-service teacher education but also curriculum reform. Our discussion suggests that teacher education programmes to benefit from a systematic approach to representing the epistemic practices of school subjects. A systemic endorsement of the value of subject epistemology across the whole school curriculum is likely to improve the likelihood of uptake of this approach in actual lessons. The epistemological aspects of school subjects can be used to empower both teachers and students in understanding how and why knowledge develops in different lines of enquiry (Erduran et al., 2007).

Introduction

The core skills and knowledge that teachers require for integrating digital technology into their teaching vary depending on the perceived role of technology in education. One common categorization distinguishes three different roles: learning *about*, *with*, and *through* technology (Pelgrum and Law, 2003; Erstad and Voogt, 2018). Learning *about* technology refers to technology as part of the school curricula for students to learn, which used to include technology-specific knowledge domains such as programming, computer operations and information literacy. Learning *with* technology refers to the use of technology as a productivity tool for learners and teachers to enhance existing methods of teaching and learning, such as the use of office applications, multimedia, internet, and interactive whiteboard. Learning *through* technology refers to technology as an essential tool integrated into curricula and the process of teaching and learning, without which the curriculum and/or the intended learning experience cannot be realized. For instance, simulations and modeling tools provide opportunities for learners to engage in a wide range of experiences that would otherwise not be possible, such as controlling a nuclear power plant, and exploring the consequences of different severities of social distancing measures on the spread of a pandemic. Access to large authentic databases and analytic tools also provides learners with different ways to explore “what if” questions in the same way that natural and social scientists do in their authentic investigations rather than simply receiving canned answers from teachers.

The different roles that technology is called upon to play in educational contexts also represent different pedagogical paradigms and visions about what learning could be like when technology is used. The key role of teachers’ pedagogical knowledge is highlighted. The success of technology integration in education depends on whether teachers have the competence to intentionally use technology for pedagogical purposes. Technological Pedagogical Content Knowledge (TPACK, Mishra and Koehler, (2006)) is a popular competence framework that describes the knowledge teachers need to acquire for effective learning *with* and *through* technology. This framework highlights the need for teachers to develop knowledge and skills that situate in the interaction space among the three knowledge domains of technology, subject matter content, and pedagogy. In a comprehensive review of international comparative studies of digital technology use and student learning, Law and Liang (2019) reported a shift in the focus of these studies from assessing students’ computing skills (following the learning *about* technology paradigm) to a focus on the pedagogical innovations that may accompany technology use for learning since the turn of the millennium, reflecting a shift toward learning *with* and *through* technology. In terms of student achievement, there is a diversification in foci to include computer-based assessment that tests students’ ability (OECD, 2010) to use digital tools to arrive at an answer (OECD, 2017), as well as students’ collaborative problem-solving ability. These reflect a priority at the policy level for digital technology use to support students in developing 21st century skills (Dede, 2014; Albion and Tondeur, 2018).

However, with the rapid progress and pervasive adoption of technology in all aspects of life, the paradigm of differentiating learning *about*, *with* and *through* technology and the TPACK framework are no longer adequate in providing a comprehensive list of knowledge and skills required by teachers for competent professional practice. The differentiation of technology use into learning *about*, *with* and *through* technology was proposed in the early 2000s (see Pelgrum and Law, 2003) when technology adoption in classrooms was either to serve additional curriculum goals (about technology) or as a tool to augment and enhance teaching and learning. However, two decades on, digital technology has been used pervasively and become an integral part in mediating communication, producing new knowledge, and augmenting everyday life and working experiences. Technological changes take place all the time, and this constant and fast changing technological landscape calls for a core competence to make use of digital technology for creative problem solving in the contexts relevant to the individual, including workplace, social and personal contexts. The technological environment for teaching and learning has also become richer. Effective integration of technology in education requires improving the digital competence of stakeholders at multiple levels, including individual teachers, school leaders, and system level leadership. Like “the fish do not know they are in water”, both teachers and students learn, work, and live in an

ecosystem permeated with digital technology. Thus, the contexts for learning *about*, *with* and *through* becomes intertwined and their differentiation becomes not that important. Technological knowledge and its deployment can no longer be isolated from other domains of knowledge, and digital competence is essential for every citizen's well-being. Teaching and learning without any use of technology greatly limits the educational possibilities available to the learner and the teacher. While teachers' pedagogical knowledge and skills remain important for the use of digital technology in education, their understanding of technology integration should become much broader than as additional augmentations in classroom teaching.

Both the European Commission (Carretero et al., 2017) and UNESCO (Law et al., 2018) have put forward digital competence/digital literacy frameworks that are applicable for everyone in the contemporary society. For teachers and associated education practitioners, this includes the ability to communicate with learners, parents and third parties; to engage in collaboration and knowledge sharing with other educators; and to use digital resources for professional development and classroom teaching (Punie and Redecker, 2017). In recent years, computational thinking (CT) has also been included as a core element of digital literacy that students should learn about. Emerging technologies, such as mobile and wearable devices, virtual reality (VR), augmented and mix reality (AR, MR), robotics, Internet of things with sensors, data science, and artificial intelligence (AI), have been gradually integrated into daily life. The implication of these emerging technologies for education is that more technology contents need to be introduced into the learning *about* technology curriculum (e.g., AI techniques, machine learning, and ethics in AI). On the other hand, a wide range of AI-driven and autonomous applications and services have been (and are being) developed to support student learning *with* and *through* technology. For example, the use of AI-powered assistive tools can help to automate learning tasks. Data-driven learning analytics tools can suggest for students a personalized and adaptive learning pathway. VR technology support synchronous and asynchronous modes of learning. Teaching and learning mediated entirely through digital technologies have made it possible for educational services to be maintained during crisis periods such as the COVID-19 pandemic.

We argue that conceptualizing teachers' competence for technology integration should go beyond TPACK and take a broader perspective of ensuring students' well-being in preparation for an uncertain future in a digital society. In this article, students' well-being is defined based on the concept of "the four pillars of education" put forward by UNESCO (Delors, 1996). According to the concept of "the four pillars of education", teachers should teach students or provide learning experience for them to "learn to know", "learn to do", "learn to live together" and "learn to be". Learning to know refers to competence in learning subject matter knowledge and skills. Learning to do is a generic competence in working with others and handling situations arising from teamwork. Learning to live together is the most important for the well-being of the society, on both local and global dimensions. It requires not only the competence to deal with conflicts, but also the appreciation of our interdependence as a global citizen and a respect for different cultures and other diversities. Learning to be is the ability to reflect and understand oneself, to act with autonomy and personal responsibility. This article provides an overview of teachers' competence needed for technology integration that is future oriented in view of the changing technological, societal and educational contexts.

Trends in learning technology development

Emerging technologies refer to the applications and services that are driven by artificial intelligence (AI), virtual, augmented, and mix reality (VR, AR, and MR), wearable devices with displays and sensors, Internet of things with 5G mobile standard, and social robotics (Vuorikari et al., 2019). These emerging technologies are part of an evolving, digitally infused, ecosystem that influence the social, mental, physical, and emotional well-being of students, and indeed teachers and other inhabitants of the "global village". In educational contexts, emerging technologies can provide immersive learning experiences, support data-driven decision-making, and AI-powered automated learning support. Head-mounted devices such as Google Glass provides a first-person view of particular learning scenarios, which can be used for the education of surgeons (Alaker et al., 2016). In a systematic review and meta-analysis of virtual reality (VR) for training in laparoscopic surgery, Alaker et al. (2016) found that wearable technologies can provide not only simulated surgical experiences, but also enable students to review the simulated surgery from different perspectives based on the self-recording of the training sessions. Bower and Sturman (2015) described applications of wearable devices in the context of augmented reality (AR) for enhanced learning experiences such as in field trips. Learners can access multimodal information (videos, photos, textual information, etc.) using diverse platforms and devices. Another important area that emerging technologies can contribute to is supporting assessment and feedback through the application of data science and learning analytics. Tracing students' performance changes over time and how such changes connect with the learner's actions and interactions based on real time multimodal data provides new possibilities for formative assessment practices, both in terms of ongoing direct feedback to learners as well as enabling teachers to redesign learning experiences.

In recent years, the application of AI to education (aka, AI in education, AIEd) has received great attention from two perspectives. The first is how AI technologies can help us understand better how student learn and provide a more adaptive and personalized learning experiences to students (Luckin et al., 2016). AI-driven educational applications are usually built on voice and facial recognition, educational data mining, computer modeling and machine learning technologies. Voice recognition allows students to ask questions and seek answers from AI-powered database. Facial recognition can be used to authenticate students' identity, Analysis of students' behavioral and performance data support autonomous decision-making and providing intelligent tutoring support (Vuorikari et al., 2019).

In addition to supporting learning and teaching, AIEd has also been introduced as a subject matter component in basic education in the K-12 school curriculum, when the goal of education is not on preparing students to become AI experts. Touretzky and Gardner-McCune (2022) identify five types of knowledge of AI that K-12 students should know, which are described as Five Big

Ideas: perception, representation and reasoning, learning, natural interaction, and societal impact. Apparently, four of the Big Ideas (except for societal impact) are about understanding how AI as computer systems can interact with the world like a human. Touratzky and Gardner-McCune argued that studying AI in K-12 should go beyond learning technology to also help students appreciate the complexity of how people think, learn, make decisions, respond, and interact with another human. The last Big Idea, societal impact, concerns the ethics of AI used, and the potential benefits and threats of AI, data privacy, etc.

For teachers and educators, learning about ethics of AI *in general* as a subject matter is not enough to teach AI. Teachers should also know about ethics of AIED *in particular* (Holmes et al., 2021) when applying AI-powered technologies in the process of teaching and learning. Ethics of AIED describes how teachers make technological and pedagogical decisions that are ethical. Holmes et al. (2021) put forward a preliminary framework for ethics of AIED. The framework identifies three foci of ethical issues of AIED: big data, algorithms and computation, and education, based on the assumption that ethics of AIED is not simply about data and computational approaches but needs to consider the ethics of education (equity, assumptions of students' characteristics, the choice of pedagogy, etc.). The Institute for Ethical AI in Education (2021) launched a comprehensive ethical framework for AIED comprising nine principles to ensure that all students can benefit optimally from AIED while being protected against adverse effects such as students losing their agency and autonomy in learning, being subjected to biases due to the data or algorithms used in the AI applications, and loss of personal privacy. The nine principles are (1) achieving educational goals, (2) forms of assessment, (3) administration and workload, (4) equity, (5) autonomy, (6) privacy, (7) transparency and accountability, (8) informed participation, and (9) ethical design. Teachers would need to have an appropriate level of understanding of AI and its implications in order to be able to make judgment and informed decisions on the selection and adoption of AIED systems and applications. Unscrupulous avoidance or adoption would harm learners' well-being in at least three of the four pillars of education: learning to know, learning to do, and learning to be.

In fact, not only AIED, but all uses of digital technology in education requires teachers/educators to consider the associated ethical consequences as well as the need to protect children's rights in the digital world. The United Nations Committee on the Rights of the Child (2021) issued the General comment No. 25 on children's digital rights that need to be respected and protected, including access to information, freedom of expression, right to privacy, digital birth registration and right to identity. The 5Rights Foundation, an organization established to promote the rights of children online, developed technical standards and protocols to ensure digital services and products cater for children and young people (5Rights foundation, 2022). It advocates regulations and international agreements in four priority areas: (1) Design of Service, (2) Child Online Protection, (3) Children and Young People's Rights, and (4) Data Literacy. Recognizing and respecting children's digital rights, and being knowledgeable about the areas of action necessary to ensure that such rights are protected are important aspects of teachers' professional competence in the 21st century, current developments regarding children's digital rights have implications for teachers' professional practice, including (1) the use of digital technology should cater for the vulnerabilities, needs, and rights of children, and help children flourish; (2) measures should be in place to protect students from exposure to age-inappropriate or harmful materials, unsafe contact from adults, cyberbullying and exhortations to gamble; (3) measures to protect children from digital harm should not jeopardize children's rights and autonomy in the digital environment; and (4) the need to equip students with adequate digital literacy so that they can make use of digital tools "knowledgeably, creatively, and fearlessly" (5Rights foundation, 2022, para. 5).

Digital literacy and computational thinking as core 21st century skills relevant for all teachers

New literacies and competencies are needed for students to thrive in the digital society, and education systems have to respond to such new requirements and renew school curricula by re-defining what needs to be learned and taught (Erstad and Voogt, 2018). Substantial changes have occurred in terms of the scope of what needs to be learned for students' well-being and for them to be able to exercise their citizenship rights and responsibilities (Law et al. (2018); Law and Lee (2023)). These changes have made it necessary for some level of digital literacy and computational thinking to become a core competence for all teachers rather than only for teachers of computing subjects.

The term "digital citizenship" emerged in the educational vocabulary since the turn of the millennium, and the increasing prominence of this strand of research is accompanied by a strong realization that the rights and responsibilities of individuals cannot be exercised without an adequate capacity to handle the complexities of living in a world where the physical and the digital are inextricably intertwined (Chen et al., 2021). Digital citizenship as a human capacity goes far beyond the technical skills needed for digital operations. While definitions of digital citizenship differ in terms of their scope, digital literacy (DL)/digital competence (DC) lies at the core of all the different definitions. The former (DL) is the term used in North America and the latter (DC) is the term commonly adopted in Europe. In this article, we use these two terms interchangeably, depending on the source we reference. The DigComp framework developed by the European Commission (EC) Joint Research Center (Carretero et al., 2017) comprises five key competence areas: information and data literacy, communication and collaboration, digital content creation, safety, and problem solving. Recognizing that the DL needed may be dependent on the infrastructural, socioeconomic and cultural contexts involved, a study to develop a Digital Literacy Global Framework (DLGF) was commissioned by UNESCO (Law et al., 2018) to take account of the development needs and realities, particularly for developing countries and economies. The main difference between DLGF and DigComp is that the former comprises two additional competence areas: hardware and software operations and career-related competences. More importantly, DLGF provides evidence that the same functional operations (e.g., a digital financial operation) may involve different digital operations and hence different kinds of DL performance depending on the digital

devices (e.g., mobile phones vs. smart phones) and the network infrastructure available (e.g., whether the available mobile network can connect to the Internet or not). It also highlights the need for DL curricula and training to be sensitive to the predominant as well as changing technological, socioeconomic, and cultural contexts.

With the rapid development of emerging technologies, such as AI, data science, robotics and IoT, there is a need to update citizens' DL so that they can engage with these technologies in different technology use contexts for learning and work. EC has been engaged in the progressive refinement of the DigComp framework over the past decade. DigComp 2.2, due to be launched in February 2022, provides an elaboration of the framework by providing examples of knowledge, skills and attitudes (referred to as dimension 4 in the framework) applicable to each of the five competence areas (i.e., information and data literacy, communication and collaboration, digital content creation, safety, and problem solving) in three specific areas of technology use for learning, for work, and for participation in society: AI systems, media and information literacy, and protecting health and well-being. It is clear from the dimension 4 elaborations that the digital competences targeted focus on ensuring individual and social well-being, and that these are relevant not only for children and youth, but for all citizens. It is also evident that the knowledge, skills and attitudes associated with digital competence would need to be integrated with those relevant to the workplace context of the individuals concerned for them to be of value to learning and work. This implies that for teacher professional development, there would be a core level of competence expected of all teachers, as well as specialized knowledge, skills and attitudes relevant to the roles of the teachers concerned.

Computational thinking (CT) refers to the ability to address real-world problems by re-formulating them into computational problems and designing algorithmic solutions that can be carried out by computers (Fraillon et al., 2019). While CT originated in the computer science field (Wing, 2008; Barr and Stephenson, 2011), the rationale for its importance in basic education goes beyond algorithmic thinking, and includes cognitive skills such as problem decomposition, problem abstraction, pattern recognition, and generalization (Wing, 2008; Grover and Pea, 2013). CT is considered as a sub-area under problem-solving in the DigComp framework (DC4JOBS, 2020). It is often considered an important 21st century competence as it is assumed that everyone will need to communicate, learn, and work with computers in the future. It has been integrated into computer science/STEM curricula in K-12 settings (Yadav et al., 2018). CT will be included as an integral part of DL in the ICILS 2023 assessment (Fraillon et al., 2019). Thus, similar to other domain aspects of digital competence, all teachers need to have a basic level of literacy in CT, while teachers with specialist roles in teaching computational subjects would need further levels of competence and possibly in a wider range of knowledge and skills.

Educational digital competence

Teachers' attainment of an adequate level of digital literacy is a precondition for their ability to adequately carry out their professional responsibilities. Several competence frameworks have been proposed to define and describe the types of teacher digital literacy that align teacher knowledge and skills to students' 21st century learning (Caena and Redecker, 2019). The European Framework for the Digital Competence of Educators (aka. DigComEdu, Redecker, 2017) was developed for the purpose of guiding teacher professional development. It comprises 22 elementary competences organized in six areas that involve the use of digital technology: (1) professional engagement, (2) digital resource, (3) teaching and learning, (4) assessment, (5) empowering learners, and (6) facilitating learners' digital competence. Areas (2), (3) and (4) are related to teachers' use of digital technologies to achieve their "traditional" roles in designing learning materials, preparing lessons and evaluating students' learning outcomes, Area 6 is about teachers' ability to foster students' DL (as described in the DigComp framework) as an extension of the curriculum responsibilities that a teacher is expected to achieve. Area 5 concerns teachers' ability to provide adaptive and personalized learning experiences to ensure the accessibility and inclusiveness of learning resources and activities offered to all learners such that students' transversal skills, deep thinking and creative expression can be fostered as an important aspect of student well-being. Area 1 stipulates that teachers need to be able to engage in professional learning and interactions with relevant communities of practice via digital technology. This area of competence ensures that teachers can have the conditions for sustainable, lifelong learning in learning to know, to do, to be and to live together as a member of the teaching profession.

The framework also puts forward a six-level proficiency model indicative of a pathway for teachers' DC development, progressing from two beginner levels—Newcomer and Explorer, to two intermediate levels—Integrator and Expert—when teachers can use technology in meaningful ways in increasingly broader contexts, to two advanced levels—Leader and Pioneer—when teachers are able to reflect on and improve their own practices, share their expertise with others, develop and lead more complex and advanced ways of technology use.

The US national educational technology standards on computational thinking for educators (ISTE, 2017) also puts forward a similar list of professional roles that teachers may play in education: learner, leader, collaborator, designer and facilitator. These standards involve a more comprehensive set of 21st-century oriented skills that go beyond subject-content and pedagogical competence and highlights the capacity of teachers as life-long learners and problem solvers. To be able to foster the development of computational thinking, teachers need to develop resilience and perseverance in addressing open-ended and ambiguous problems, be able to cope with failure and treasure such experiences as valuable opportunities to learn. In terms of professional practice, teachers should learn (1) approaches to establish an inclusive culture that respects diversity, (2) collaboration skills to work with colleagues and students to create meaningful learning opportunities, and (3) a creative design mindset to inspire students in the process of problem solving.

The key drivers of economic growth have changed from manufacturing and services to information and knowledge, and collaboration, information sharing, and self-management have become increasingly important abilities in the workplace (Kozma, 2009). The UN Agenda 2030 for Sustainable Development delineates 17 sustainable development goals (SDGs) which are perceived as important for education systems worldwide. Teachers need to be well-prepared to guide students to achieve these goals with the support of technology. UNESCO launched the third version of the ICT Competency Framework for Teachers (ICT-CFT) in 2018 to take account of these goals. There are six aspects of teacher knowledge and skills under each stage: understanding ICT in education policy; curriculum and assessment; pedagogy; application of digital skills; organization and administration; and teacher professional learning.

According to the 2018 ICT-CFT framework, pedagogy is important for technology use to support student-centered, collaboration and inquiry-based problem-solving to foster students' 21st century skills in alignment with national policy documents. With regard to curriculum and assessment, teachers should be able to identify the types of technology conducive to the achievement of specific curriculum goals and how technology use can support assessment. This requires that teachers take into consideration emerging technologies relevant to different aspects of the competence framework, with a focus on those that foster students' 21st century skills through learning experiences that engage learners in problem-solving, communication, collaboration, experimentation, critical thinking, and creative expression. For organization and administration, teachers should be able to engage in social networking for knowledge management and professional development, and to use AI-supported software to streamline administrative management processes. At the leadership level, teachers need to learn how to transform schools into learning organizations capable of actualizing the implementation of e-learning. Similar to the other teacher competence frameworks, the teacher professional learning aspect also focuses on the use of technology that empowers teachers to be life-long learners for sustainable professional development.

In the teacher learning literature, Technological Pedagogical Content Knowledge (TPACK) is a competence framework that describes the knowledge teachers need to teach competently using digital technologies (Mishra and Koehler, 2006). This framework highlights the need for teachers to develop knowledge and skills that situate in the intersection space among the three knowledge domains of technology, subject matter content, and pedagogy. There are four areas of interaction in this framework: technological content knowledge (TCK), technological pedagogical knowledge (TPK), pedagogical content knowledge (PCK), and all three taken together as technological pedagogical content knowledge (TPCK).

Yeh et al. (2014) emphasized the importance of practical skills for competent implementation. They put forward a TPACK-Practical framework comprising eight practice dimensions, namely, using ICT to understand content, using ICT to understand learners, planning ICT-infused curriculum, using ICT representations, using ICT-integrated teaching strategies, applying ICT to instructional management, infusing ICT into teaching contexts, and using ICT to assess students. Ethical issues are also an important aspect that teachers need to address when using emerging technology. Benton-Borghi (2013) proposed an infusion of universal design for learning (UDL) with the TPACK framework in order to cater to the needs of all learners, including marginalized groups (e.g., those from low SES backgrounds, racial/ethnic/linguistic/cultural minorities, those with disabilities). This extension guides teacher's pedagogical decision-making regarding delivery models, suggests multiple options for the representation of and ways to access the content.

While the TPACK framework specifies the knowledge domains necessary for teachers to integrate technology into teaching and learning, teachers' design competence is also crucial for their effective mobilization in different course and learner contexts. When knowledge creation and authentic problem solving are key competences to be fostered in students, the teacher's role needs to change from an instructor who delivers well-defined facts and skills to a designer who carefully crafts the technology-enhanced learning environment within which students can learn proactively and productively through self-directed inquiry, problem-solving and creative (co-) constructions. Learning design is a field that engages in "devising effective learning experiences aimed at achieving defined educational objectives in a given context" (Mor et al., 2015, p. 221). Learning design is complex because it involves different levels of decision-making: course/curriculum unit, curriculum component, and learning tasks (Law and Liang, 2021). Design decisions at hierarchically nested levels need to be guided by pedagogical philosophy, approach, strategy, and tactics respectively (Goodyear, 2005). Moreover, learning design competence includes the ability to make use of learning analytics to inquire into student learning (Hansen and Wasson, 2016) for continuous improvement of design principles and practice. Teachers' participation in a co-design process to choose and make sense of learning analytics tools is proven to be crucial for effective adoption and integration of LA technologies (Rosé et al., 2019).

An important aspect of teacher learning regarding emerging technologies is whether the user recognizes the pedagogical affordance of the technology. Here, the word "affordance" is interpreted as defined by Norman (1988), which is the perceived affordances (aka possibilities) rather than the designed affordances that are most important in influencing their usage/application. Angeli and Valanides (2018) hypothesize a five-stage process for the pedagogical affordances of technologies to be actualized. The first stage requires the necessary technical affordances to be made available as built-in functions made available in the form of educational applications/tools. The second stage involves the teachers' recognition and familiarization of the technical affordances of these applications. For example, concerns about the privacy, ethical and social issues brought about by the capacity of wearable technologies to instantaneously broadcast information about the wearers (Gill, 2008) can only be raised by those who recognize the possibilities that such technologies bring. To advance to the third stage requires that the teacher perceives the pedagogical affordance of the tools, i.e., the pedagogical actions that can be enabled through the technical affordance. For example, a teacher may be able to perceive and make use of natural language processing AI tools such as Amazon Alexa as a handy dictionary in her own work. For teachers to recognize that this same technology can be used to help students to improve their pronunciations if they can be

encouraged to talk to these AI agents requires a third stage of teacher learning advancement—perception of the pedagogical affordance that can be leveraged through the technology. While the first three stages involve conceptual recognition, the fourth stage concerns the actualization of the pedagogical potential of the technologies concerned. This requires the fulfillment of additional conditions, including the teacher possessing the necessary instructional design and implementation skills, the availability of the necessary technological infrastructure and resources, as well as the compatibility of the affordance with the school's curriculum and developmental priority. Actualization would be accompanied by visible observations of the impact on student learning, which in turn deepens the understanding about the affordance, leading to a fifth stage when those involved in the technology-supported pedagogical innovation can reflect on the experience and revise their perception of the possible affordances and pedagogical designs in the deployment of the technology.

Angeli and Valanides' (2018) five stage framework indicates that TPACK only covers the first three stages, and is inadequate for the effective actualization of the educational potentials of digital technology. Han and Patterson's (2020) empirical study of the challenges encountered by an elementary teacher in his attempts to use VR in his teaching found that the obstacles were multifaceted. These included not only teachers' TPACK in integrating VR into the school curriculum, but also some generic skills. For example, the teacher had to communicate with parents and students to make explicit the expected process and outcomes of the VR lessons. He also needed to make an alternative plan to cater for students with motion sickness. Managing the budget, space, and time limit for the actual implementation of VR were additional concerns for the teacher. These findings are consistent with EC's DigComEdu framework, which stipulates that teachers' digital competence need to go beyond technology and pedagogy, such as interacting and sharing with colleagues, collaboration within schools, and communicating with parents. Porras-Hernández and Salinas-Amescua (2013) enriched the TPACK framework by including two dimensions of contextual knowledge: scope (encompassing three nested levels: macro or system level, meso or school level, and micro) and actor (students' and teachers' inner and external context). These two dimensions are intertwined, with teachers' and students' characteristics, needs, preferences, prior knowledge, self-efficacy, pedagogical beliefs, subject discipline, school culture, ethnicity, community culture, and socioeconomic background being prominent contextual aspects to be taken into consideration in the actualization process. In addition to knowledge.

In summary, a teacher's educational digital competence involves knowledge and skills in the intersection of technology, pedagogy, and subject matter content, as well as learning design competence to construct and orchestrate appropriate learning environments and learner experiences for students to achieve the desired outcomes, including achieving appropriate levels of digital competence. A core challenge for teachers as the learning designers is to provide learning experiences that foster learner agency, protect learners from cyber risks while ensuring their rights to participate and benefit from engagement and interactions in cyberspace. In addition, for teachers to actualize the affordances of digital technologies for learning, they need communication and collaboration skills to work with parents, colleagues, and other stakeholders to create the necessary conditions to implement technology-enhanced learning innovations. These are tall orders that can only be achieved through appropriate leadership at the institution and system levels that builds a collaborative culture and supportive communities of practice for teachers to experiment and share their visions and experiences. Teacher's effective use of technology also depends on the technical infrastructure available to them and the social infrastructure to provide appropriate administrative and professional support.

Lifelong learning capacity for a future-ready teaching profession

It is clear from the preceding discussion that the knowledge and skills required of the teacher are evolving with the rapid development of technology, and there is an increasing recognition that the use of technology in education should prepare students for the future. At the turn of the millennium, learning about technology was considered as a low level of technology integration in education (cf. Law, 2010). With the rapid advances in digital technology and their pervasive deployment in all aspects of our lives, at work, for learning, socialization, entertainment, as well as to exercise our rights and responsibilities as a citizen, the ability to master the use of emerging technologies in daily life and work is crucial for the well-being of individuals and societies. Education systems need to build in mechanisms for agile adoption and adaptation of new technologies to support learning and teaching that supports professional learning and cares for teachers' well-being in the process.

The COVID-19 pandemic serves as a case to demonstrate how digital technology can help schools and universities to provide instructional services to students even under strict social distancing measure. At the same time, it also shows that the effectiveness of the online learning arrangements depends on how well-prepared different systems and institution are regarding the use of digital technology in learning and teaching before the pandemic started. The preparedness includes the availability of appropriate technology infrastructure, access to devices, digital competence of teachers and students, as well as their prior experience in e-learning (Law et al., 2021a). The pandemic was the Black Swan that forced teachers worldwide to seek solutions from technology, which was not necessary before the pandemic. Teachers have to move existing face-to-face classroom practices to synchronous (e.g., Zoom, Google Meet) and asynchronous online tools (e.g., Moodle, Google Classroom) as an emergency and tactical response to crisis. In contrast to the well-planned blended or fully online learning designs, the shift to online instructional delivery due to the pandemic is often referred to as emergency remote teaching (ERT) in the literature (Hodges et al., 2020; Reynolds and Chu, 2020), instituted to maintain as far as possible the existing educational service during the crisis situation. On the other hand, there are others that took the forced use of digital technology for teaching and learning as an opportunity for long-term innovation of the educational ecosystem (Hodges et al., 2020), and coined the vision of a "New Normal" after the pandemic (Law et al., 2021a;

Berwick, 2020). While ERT may provide some stopgap relief, teachers' digital literacy and TPACK are crucial for technology deployment to effectively achieve the intended outcomes. During the pandemic, digitally competent teachers were able to use social media (e.g., twitter, Trust et al., 2020) and online learning communities (Borup et al., 2020) to strengthen interaction, share and collaboratively design with colleagues. 360 video recordings (Zolfaghari et al., 2020) and VR simulations (Sasaki et al., 2020) can be used to provide immersive learning environments for teachers to implement and reflect on their teaching practices. König et al. (2020) conducted a survey on 165 early career teachers in Germany who adopted online teaching during COVID-19 school closure. They found that teachers' TPACK was significant in predicting their ability to maintain social contact and to provide task differentiation (through online adaptive teaching).

Since the role of TPACK is still prominent in influencing teachers' responses to the crisis, digital divide among teachers was found to be a barrier for the successful implementation of ERT. Iivari et al. (2020) conducted case studies on teachers' response to the crisis in Finland and India, and found that teachers who had a high level of digital literacy showed greater resilience, creativity and perseverance in responding to the challenging situations due to COVID-19. Gudmundsdottir and Hathaway (2020) investigated US and Norwegian teachers' readiness and agency during the pandemic using a four-dimensional model of competence: pedagogical, ethical, attitudinal, and technical. They found that most due to teachers in their study were well-prepared in the dimension of technical and attitudinal dimensions, but not in the pedagogical and ethical dimensions.

The COVID-19 pandemic sends a clear message that we need to be prepared for the unexpected. Code et al. (2020) argued that teachers who were better prepared in responding to emergencies and continue to cater for their students' well-being do not only need digital competence, as the abrupt transition to online teaching is a process of transformative learning for the teachers concerned (Mezirow, 2006). During such transitions, teachers experience "a deep structural shift in thought and action" that force them to rethink how they teach and how students learn. Frameworks from the field of learning design may provide a useful lens to support teachers in making flexible use of online technology tools and resources in an agile manner to transform their teaching into blended/fully online modes. Code et al. (2020) proposed a learning design framework that highlighted six aspects that teachers need to reconsider in their design of blended learning: authentic backbone (the core task to be performed); agency (the roles of students and teachers); spatial (the locations for learning to take place); instrumental (the kinds of tools to be used); temporal (the timeframe and sequence of learning tasks); and quick wins (solutions and resources that can be quickly deployed).

For ERT to be a successful process of transition into a New Normal in which the online learning provided to students are transformative in ensuring student agency and catering for diversities requires not only preparedness at the teacher level, but also holistic changes at the school leadership level to support teachers' technology integration practices. In a study to investigate how students, parents, teachers, and school leaders in K-12 schools in Hong Kong were responding to the crisis situation during the first half of 2020, and the extent to which well-being was maintained for different stakeholders in the process, Law et al. (2021b) made several important observations: (1) teachers' online teaching preparedness at the school level has a strong influence on students' online learning participation, academic self-efficacy and the learning of DL skills; (2) schools' e-learning strategic plans and their implementation before the pandemic, including the e-learning coordination team composition (e.g., membership includes senior leaders in the school) and functions (e.g., the ability to allocate human and physical resources, to make decisions on changes in school routines), infrastructure priorities, and teacher professional development provisions were significant predictors of teachers' online teaching self-efficacy and students' self-reported improvements in DL during the pandemic; and (3) a school-wide culture of openness to innovation and a climate of collaboration, mutual trust, and collaboration at the school level were key to predicting teacher preparedness for online teaching.

Results of the Teaching and Learning International Survey 2018 (TALIS 2018) show that just over half of the surveyed teachers in OECD (53%) reported frequent use of technology for students' class work (OECD, 2019). How should education in the post pandemic period prepare educators and students for an unpredictable future? What kinds of teacher and student capacity can deal with rapid, unpredictable change in the workplace and in society? Richards and Dede (2020) proposed a "60-Year Curriculum" (60YC) as a new model of lifelong learning to cater for unpredictable and constant transitions. Lifelong learning takes place in a global network where learning content (i.e., the knowledge and skills required by the work) and processing tools (technologies and resources that support the work) are available for those prepared for "just-in-time" learning. To prepare students for an unpredictable future as a citizen living in a society in which the physical and the digital are merged and no longer distinguishable (the so-called metaverse), it is even more important for teachers to help students build and exercise transversal skills (often referred to as 21st century skills) in the cognitive, intrapersonal, and interpersonal domains. In this context, teachers' continuous professional learning needs to be supported by various kinds of network and collaboration partnership that provides opportunities to interact and learn from other education professions, including pedagogical coaches, experienced teachers, teacher educators, and educational researchers.

Schools are increasingly incorporating mobile digital tools into classroom teaching that have diverse uses. On the one hand, there has been some criticism that these digital tools are used to replace physical resources (e.g., books) without making teaching more effective. On the other hand, some research on the use of digital tools in mathematics classrooms has shown that they can have a positive impact on teaching and learning. A deeper understanding of the factors impacting teachers' use of digital tools is needed to help better realize the potential of digital tools to influence classroom practice. This paper contributes to this domain of research by investigating the factors impacting the way four secondary mathematics teachers in England have used tablets in their teaching for a period of 18 months, and the role knowledge exchange played in their developing use. The study introduced a structured method of knowledge exchange, which used guiding questions to facilitate teachers' discussions and encourage knowledge exchange, in order to develop teachers' use of tablets in teaching mathematics. Our analysis is based on individual interviews, classroom observations, post observation interviews, and conversations among the teachers in group meetings which we organized to enable teachers to share their knowledge and experiences in using tablets. In this paper we present the aspects of *factors* and *knowledge exchange* of the Teacher Adoption of Digital Technologies framework, which we developed to articulate and examine how digital tools can be valuable to teachers even when they may appear similar to physical tools. Our findings show that there are seven categories of factors that impact teachers' use of digital tools and that a structured knowledge exchange among teachers can help teachers address underlying issues related to these factors. Implications of teacher professional development and future research are discussed in light of these findings.

Introduction

The Organization for Economic Co-operation and Development (OECD) has declared that "despite considerable investments in computers, Internet connections and software for education use, there is little solid evidence that greater computer use among students leads to better scores in mathematics and reading" (OECD, 2015, p. 145). This outcome raises questions regarding the reasons why powerful technologies, that have the ability to perform complex computations and demonstrate concepts in new ways, have not had an impact on scores in mathematics. This is particularly pertinent as the history of mathematics—which is the discipline this study is focused on—has examples showing that the availability of certain tools has influenced the course of the conceptual development of mathematics as a scientific discipline (Laborde and Sträße, 2010).

It is increasingly being recognized that more focus needs to be placed on the teacher's role in how to enhance teachers' professional knowledge in relation to the use of new technologies (Noss and Hoyles, 1996, p. 184). However, traditional professional development, the most widely used way of helping teachers integrate new technologies, is often ineffective (Opfer and Pedder, 2011) and is also hard to scale up (e.g., because of financial constraints) to help large numbers of teachers. The approach of creating opportunities for teachers to meet and exchange their knowledge and experiences around the use of technology in their teaching is easier to scale up and has been found to hold some promise (Clark-Wilson et al., 2015; Ertmer and Ottenbreit-Leftwich, 2010). Indeed, teaching networks have been found to be extremely useful, both in person and online, by many teachers (Trust et al., 2016) in that they provide a peer community in which knowledge, experiences, and resources can be shared. Unfortunately, though, having a learning community either online or in-person, is not the norm for most teachers.

One of the reasons, as Joubert (2012) suggests, for why technology is not incorporated effectively in education, include research not sufficiently accounting for the interests, issues, concerns, and developments of the researchers and stakeholders in mathematics education. This study aims to contribute toward addressing these gaps by focusing on key stakeholders, being the teachers, and their experiences of using technology in their daily classroom teaching. There also needs to be further research in naturalistic school settings on the link between teachers' technology use, particularly technology that offers multiple non-mathematical programs like tablet, and their classroom instructional practices (Rakes et al., 2006) as well as how teachers become absorbed into these existing and evolving practices (Merchant, 2012). This was the approach used in this study, where all interactions by the researcher were designed to have minimal interference with the natural setting of the school.

The broader study from which this paper is drawn (Petrovai, 2018) was designed to address the concerns and opportunities outlined above. In partnership with a comprehensive British school that has implemented a one-tablet-per-student program, the study investigated the way four Year 8 (12–13 year-olds) mathematics teachers' use of, and views on, tablets in their teaching developed over time, and the factors impacting them. The teachers in the study were given pseudonyms to mask their identity and gender. The study was situated in a natural school setting, with the added dimension that teachers met four times as a group to discuss their use of, and views on, tablets while exchanging knowledge about using tablets in their teaching. These meetings were facilitated by the first author, whose role was to ask the teachers questions that guided them to reflect on their practice and discuss ways of using tablets in a group setting, but not to provide any information. The data collected included audio recordings of the group meetings, individual teacher interviews at the start of the study, classroom observations, and short interviews with teachers directly following each observed lesson.

The result of the study this paper is drawn from was the development of a framework called the *Teacher Adoption of Digital Technology* (TADT) framework (Petrovai, 2018). This framework was designed to capture the teachers' experience of using a digital technology (in this particular case a tablet technology) and examine how this use developed over time. The TADT framework is intended to be a living framework, that can expand and change, used as a guide to facilitate conversations among teachers to help them learn from each other. There are four distinct parts of the TADT framework:

1. **Use** is broken down into Laborde (2001) framework of instrumental evolution. As this framework is progressive, with the tasks using technology in progressively more complex ways, the categories are represented in step format. This step format is to clearly indicate that the categories of tasks are progressive.
2. **Views** captures the ways teachers see tablets and their use of them.
3. **Factors** are a cumulative list of factors that teachers indicate as important in defining the way they use and view the tablets in teaching mathematics. Although the factors in the initial framework were drawn from the literature, additional factors emerged from the particular teachers in the study.
4. **Knowledge Exchange** captures the instances when teachers share exchange knowledge during the group meetings on how they use and manage tablets in their classroom.

This paper focuses on the Factors and the Knowledge Exchange portions of the TADT framework, that is, it aims to understand the factors that impact teachers' use and views of digital technologies as well as how structured conversations among teachers can help in knowledge exchange and addressing the factors impacting them. The literature in which this study is situated is outlined in the following sections.

Factors that impact teachers' use of technology

Tools have greatly influenced how mathematics is understood and taught in the classroom, an example of this is the ruler and compass for the development of geometry (Laborde and Sträße, 2010). However, there are questions on the level of impact one of the most recent tools—mobile technologies—may have on the way mathematics is taught and learned. Mobile technologies are increasingly being introduced in schools with little evidence to guide how they are implemented (Kiger et al., 2012).

There are numerous factors that may impact the way teachers use technology. In a study investigating the integration of online learning in 26 Australian schools, lack of time was found to be a key factor (Neyland, 2011). In this same study, teachers were found to be very frustrated by technical issues they encountered, both with the infrastructure and the network. Moersch (1995) discusses five distinct problem areas of computer usage in education: (1) staff development was usually insufficient and misdirected; (2) computers tended to be used for isolated activities unrelated to central instructional themes or concepts; (3) computer usage was one step removed from the classroom teacher; (4) technology usage sustained the existing curricula rather than being a catalyst for change; and (5) technology plans failed to establish a link between the need for technology and identifiable instructional priorities. In his 2007 study, Franklin indicated additional barriers to success. Even teachers who were well educated in the use of educational

technologies and graduated from a university that won numerous awards for preparing teachers to teach with technology, those teachers did not always use their skills once they started teaching. Several authors have also written about the lack of effective teacher training on the use of classroom technologies (Guha, 2003; Mentz and Mentz, 2003; Tsitouridou and Vryzas, 2004; Pelgrum, 2001).

There are many ways of looking at factors that impact teachers, which can vary depending on a number of reasons such as the training teachers received, the type of technology they are using, the school environment, or the teacher's personal experiences and beliefs. The research reviewed in the previous paragraph often points to factors that are not necessarily ones given by teachers as impacting their choices. Although all factors need to be understood, it is important that the factors teachers feel impact their decisions of if, and how, they use technology in the classroom, are also understood. In this study the factors that are captured are those that the participating teachers themselves raised as impacting their use of tablets. Gathering this information gives insight into their experiences but can also be used to address their further development.

Developing teachers' use of technology

There can be many reasons and factors contributing to why teachers may, or may not, develop their use and views on tablets over time. Even if they do develop in some way, research indicates that any change without some type of assistance takes a long time (Laborde, 2001). There are many ways that professionals can learn in the workplace, but they are not without challenges. Schools can be particularly challenging places as there are many different demands placed on a teacher's time. This section first outlines the literature on teachers' learning needs with regards to integrating technology into the classroom, followed by the role of professional development in schools, and thirdly the concept of Professional Learning Networks and how they can be helpful to teachers.

Teachers' learning needs

Both the success of integrating technology into the classroom, and the degree to which students can benefit from a technology-enriched environment, depends largely on what the teacher does with these tools. This is well understood, and the development of teacher competencies for technology use has been the focus of current educational reforms worldwide (Chronaki and Matos, 2014). Tools are not neutral: they change the actions of the users as well as significantly affect their conceptualization of reality (Vérillon and Rabardel, 1995). Central to the idea of integration of technology in teaching is the understanding and developing of teacher professional development (English, 2009). Several authors have written about the lack of effective teacher training on the use of classroom technologies (Guha, 2003; Mentz and Mentz, 2003; Tsitouridou and Vryzas, 2004).

The teachers in our study will discuss ideas together, but will design the lessons outside of the group meetings. Some may assume that this type of learning is only needed for teachers who are unfamiliar with technology. However, Ma et al. (2005) found that, although young teachers have grown up with computers, they may not automatically use technology effectively to improve the way students learn. It is unlikely that students, who have grown up with digital technologies, will learn to use computers in ways that benefit their learning as adults, unless their teachers have modeled effective technology use in schools (Fuller, 2000). This is important for our study, since some of the participating teachers were young enough to have had digital technologies in their school as students, however that does not mean they learned to teach with them. Like with any skill, guidance and training is needed for all teachers to know how to use technology in a way that will elevate their teaching and enable greater learning. Professional development plays an important role in this type of growth.

Role of professional development

As mentioned above, the main audience for teacher training on how to use technology in the classroom is not limited to those who are unfamiliar with digital technologies. Even among teachers who use technology in their existing instructional practices, some have found that they rarely take full advantage of its potential or use the technology to teach in new ways (Dawson, 2012). One factor may be the shortcomings of professional development and lack of support for teachers, which is already well documented (Ertmer and Ottenbreit-Leftwich, 2010; Opfer and Pedder, 2011). In mathematics, as in other STEM (Science, Technology, Engineering, and Mathematics) subjects in the K-12 classroom, there have been found to be significant challenges for teachers. Steep learning curves and the challenge of gaining confidence and skill at guiding students through complex activities within the constraints of the K-12 classrooms all add to the difficulty of using mobile devices (Parker et al., 2015). It is not that teachers are luddites, it is often likely that educational practitioners are already using 21st century methods and strategies in varying degrees and simply need additional support and professional development to ensure full application (Gunn and Hollingsworth, 2013).

Professional development needs to move away from the traditional model of sending teachers on an occasional course to develop their skills. Gunn and Hollingsworth (2013) have found that, "while sporadic professional development has been known to incite temporary adoption of new methods or innovations, widespread teacher change is only possible through thoughtful and systematic implementation of critical knowledge, skills, and strategies" (p. 204). There are many ways that such professional development may be achieved.

Heitink et al. (2016) stated that "[t]eachers' effective use of technology might be improved if they become better able to articulate the reasoning behind the use of technology in their teaching, share this reasoning with colleagues and confront their reasoning with findings from research." (p. 82) This suggests that one way in which professional development may be effective is by having teachers share knowledge and experience among themselves, through learning networks. Having such networks in the workplace may also be beneficial as Short (2014) found through a review of literature on learning in the workplace, that trust is extremely important and face-to-face connection with colleagues helps build this trust.

Professional learning networks for teachers' development

The notion of *Professional Learning Networks* (PLN), also referred to as Personal Learning Networks, was first coined by Tobin (1998). Tobin defined PLN as a "group of people who can guide your learning, point you to learning opportunities, answer your questions, and give you the benefit of their own knowledge and experience" (Tobin, 1998, para. 1). Such a network can take many different forms. These networks may include online chat rooms, conference gatherings, or formalized networks within an organization. What they all include is an ongoing communication and exchanging of knowledge among the different members. Communication has been found to be an integral part of learning, and in a study by Swallow (2015) it was found that communication between and among teachers and students was a consistent critical component in the integrating mobile devices into the classroom. Ruthven (2014) review of thirteen mathematics teacher networks found that most described some form of positive change in classroom practice.

Both in England and around the world, teachers who have not found the support they needed have taken the initiative to take their own professional learning and development in their hands by developing online PLNs (Trust, 2012). The flexibility of digital technologies to have anytime, anywhere availability of expansive PLNs, and their capacity to respond to educators' diverse interests and needs may have the ability to fulfill some of the professional growth requirements a teacher might have. Jones (2011) went as far as to say that "while access to computing power may shortly no longer be a source of an unbridgeable 'digital divide', differential access to networks of people that provide support for, and nurturing of, educational innovation via ICT may be an emerging new form of 'digital divide'" (p. 43).

Although there are many benefits, joining online PLNs does require a certain level of being digitally savvy and having the time to initiate such involvement. Incorporating the essence of a PLN into a school setting would remove the barriers of entry that some teachers may face. In addition, fostering a learning network among the teachers at a school has the added benefit that they share the challenges and opportunities of the context they are in. In addition, everyone would benefit from the knowledge members acquire outside of the school. As part of this study, we were influenced by the idea of learning networks, and we introduced and fostered a PLN among the participating teachers. This network was fostered through regular face-to-face group meetings among the participants facilitated by the first author. The essence of the group meetings is for the teachers to learn from each other. To have a quantitative representation of this learning, we will capture the instances they exchange knowledge with each other, which we will refer to as *knowledge exchange*. Exchanging knowledge among peers is important aspect of this study as it is very popular with teachers and it is an effective way of developing existing practice (Trust et al., 2016; Clark-Wilson et al., 2015; Ertmer and Ottenbreit-Leftwich, 2010).

Methodology

The broader study from which this paper is drawn had two phases. Phase 1, referred to as *Setting the Foundation* phase, aimed to identify the context in which the study was run and define the baseline for how the teachers used tablets, and their views on, tablets at the early stage of the study. The three methods used to achieve this were, school visits, classroom observations and teacher interviews. The results of Phase 1 informed the final design of the methods used in Phase 2, as well as the creation of the revised TADT framework. This enabled the methods of Phase 2 to be further embedded in the context of the regular daily setting of the school within which my study was situated. This was an important aspect of how the study was designed. Phase 2, referred to as the *Evolution of Use* phase, aimed to identify how over the course of six months the teachers developed, or stayed the same, in their use of, and views on, tablets in the teaching of mathematics. The three methods used to achieve this included classroom observations, post observation interviews, and group meetings. The methods that included data for Factors and Knowledge Exchange were the following: teacher interviews, post observation interviews, and group meetings.

- *Teacher interviews* were used to include the teachers' perspective, at an early stage of the study. Interviewing each teacher individually set a starting point from which any possible development in their use of and views about tablets might be seen over the course of the study.
- *Post observation interviews* were used to dig deeper into what the first author observed in the classroom and understand the teachers' views on how tablets were used, the reasons they chose to do what they did, and the factors that contributed to their choices.
- *Group meetings* aimed to give the teachers an opportunity to reflect on, and develop, the way they used tablets in their mathematics teaching and learn from their peers. The first author facilitated the meetings by asking specific questions to guide the conversation.

Group meetings

Purpose

As outlined in the literature review, teachers' professional development is a critical part of integrating technology into their teaching. Basing it on the literature on Professional Learning Networks, the group meetings are aimed to create a similar environment in which teachers can learn from each other and share their experiences of using tablets to teach mathematics. The three main reasons for having group meetings were as follows:

1. The meetings served as group interviews, which have the benefit of allowing participants to elaborate on each other's ideas and experiences, giving depth to the individual interviews.

2. The meetings served as a dedicated time in which teachers could develop their use of tablets in their teaching. Other studies have shown (Dwyer et al., 1990; Laborde, 2001; Ertmer and Ottenbreit-Leftwich, 2010) that without any training or guidance, it takes years for teachers to change and develop their use of new technology in their teaching. A major aspect of this study was to situate it in a school setting in such a way that would be sustainable for any school to adopt the framework that emerges. For this reason, rather than having specific external training for teachers, the group meetings served as peer training. There are three main reasons for this approach. First, the cost-effective nature of this approach would enable other schools to use this model. Second, it allows schools to tap into the diverse knowledge and experience that teachers already have, and share it among each other. Third, it ensures that the training takes into account the specific context of the school and the specific circumstances and challenges that the teachers face, which is likely to impact the way they use tablets in their teaching.
3. The meetings provide added value to the participating teachers. In the initial informal conversations teachers expressed a desire to learn and develop their use of tablets in their teaching, which is why having time to train was something that they found valuable.

Conducting the group meetings

The first author took on the role of the facilitator of the meetings. Her role was to set goals, ask questions, allow the conversation to develop, and pick at important points that were raised to understand the teachers as much as possible. The facilitator ensured that all teachers had a voice in the conversation and could express their thoughts. The goals were stated at the start of each meeting, and possibly gently nudged the conversation while it was taking place, which was the extent of my intended interference. It is possible that the information they provided was influenced by the facilitators presence, but great care was taken to minimize involvement. If the conversations were about the use of tablets in their teaching allowed conversations to develop. It was assumed that the teachers expressed what was most important to them. To capture the most honest data possible, it was important to allow the group meetings to be organic and allow teachers to express their thoughts and feelings.

In the following paragraphs outlines the themes of the questions asked during each meeting. The approach was to be flexible and alter the questions for the meetings following the second meeting based on the outcomes of the previous meeting.

Group meeting 1

The goal of the meeting was to establish a benchmark of how the teachers were using and thinking about the use of tablets in their teaching. To start the conversation, the guiding questions begin by asking the teachers' opinion of the tablet program and how they are currently using the tablets. The questions go further to ask how they do/would like to use the tablets and the reasons why. The meeting ends by asking the teachers what their expectations are of the group meetings.

Group meeting 2

The goal of this meeting was to think about concepts that will be taught in the upcoming lessons, which could benefit from the use of tablets. The questions went from reflecting and exchanging ideas on how tablets were being used, to discussing upcoming mathematical topics being taught that may benefit from using tablets. The final part of the meeting challenged the teachers to think about differentiation and how tablets can be used to address not only difficult mathematical concepts but also how they may address different type of students learning needs.

Group meeting 3

This meeting was aimed at continuing to push everyone's thinking about ways in which the tablets could be used in the classroom by digging deeper into more details. Teachers were asked to reflect on their recent practice, successes and challenges of using tablet, as well as new ideas they can use in the future, with prompting questions on the benefits, drawbacks and details of how it would help students.

Group meeting 4

The goal of the final meeting was to reflect on the journey taken by each teacher during the study and to discuss ideas for future use. Prior to the final meeting, the school unexpectedly decided to change the tablet program and remove tablets during the transition. The questions in this meeting focused on reflecting on how the teachers changed their use of tablets over time, the impact they saw on teaching and learning, and the value they saw in using tablets to enhance mathematical understanding.

Developing the group meeting coding scheme

The criteria for coding something as a knowledge exchange was when one teacher makes a statement about the way they use, or wish they could use, tablets in their teaching and another teacher added to the conversation either by providing ideas, sharing experiences, or giving instruction on how to use the tables in similar situations. This type of exchange identifies how the factor of working with colleagues can influence the teachers' considerations in how they use the tables.

Table 1 Definition of factors.

<i>Factors</i>	
Time	Time available to prepare or learn to use tablets
Resources	Resources, software or hardware, available to use tablets
Technical issues	Issues concerning technical challenges with the hardware, software, or infrastructure
Mathematics misunderstood	Issues related to actions or policy that does not fully consider the needs of mathematics teaching and learning
Support	Support provided to the teachers from the leadership or technical team
Management	Decisions made by school leadership that impact teachers' use of tablets
Classroom management	Classroom management concerns caused by the use of tablets

Results

There are many factors, and ways of looking at factors, that impact teachers, as shown by the literature, but addressing those factors at a particular school may not be relevant. There are also factors that are important but other research have not highlighted. This study found seven factors that the teachers indicated as having an impact on their work, as defined in [Table 1](#). As outlined in the previous section, the results came from individual teacher interviews, post observation interviews, and the knowledge exchange group meetings. The abundance of knowledge exchange conversations in the group meetings are categorized into three overarching themes. In these three themes of conversations, the seven factors that teachers expressed as impacting their use of tablets in teaching mathematics are addressed. In this section each of the factors and themes of knowledge exchange are discussed in more detail ([Table 2A–C](#)).

[Table 2A–C](#) presents the results of the study for Factors and Knowledge Exchange. As can be seen, the most frequently mentioned factors are slightly different for each method. [Table 2A](#) shows that classroom management and time were the two most frequently mentioned factors in the individual teacher interviews, each being mentioned by all the teachers. In the post observation interviews, [Table 2B](#) shows that classroom management and resources were mentioned significantly more than others, with 17 and 12 mentions respectively. In the group interviews, [Table 2C](#) shows that the most frequent factors discussed were resources and support, with each being mentioned by at least two teachers in each of the four group meetings. Although the frequencies are important, the greater importance is on the factors that emerged from teachers and the abundance of the knowledge exchange conversations in each group meeting. The following two sections explain in more details the results for Factors and Knowledge Exchange.

Factors

Factors emerged from all of the interactions with the teachers. During the group meetings most of the conversations among the teachers focused on the factors impacting the use of tablets in their teaching. This is not surprising as [Mumtaz \(2000\)](#) also outlined a multitude of factors that was synthesized from literature. One of the greatest factors impacting teachers' use of tablets was time because the "pressures of work inside and outside the classroom, timetabling does not allow time for such learning [about ICT]" (p. 334). This was certainly a factor that came up often among the teachers.

Time available for teachers to prepare lessons or learn and use tables was a factor mentioned by all teachers. In the initial interviews, Jordan said that she saw great value in tablets providing individualized learning, something she valued. Although she was incorporating some individualized learning with digital worksheets, but it was not to the extent she could imagine. However, it was the lack to time that she said really prevented her from implementing that, as she described.

I can happily create traditional resources that are read on an iPad, such as a PDF, so that is still a step up from just giving a worksheet, but it's still not interactive. So, in terms of creating resources, that is something that would be useful, but I don't have the capacity at the moment to create an interactive resource that is built for an iPad.

Charlie also said that lack of time was the greatest factor that impacted her ability to research tools and resources to use on tablets. However, she said that having the first group meeting was extremely beneficial and it did start the ball rolling toward more integrated use of tablets in her mathematics class.

The biggest positive for me is that I have seen it work. I'm enthused enough to know that I would like to do some more. If I could cut down the amount of time, or find a shorter way to get really good resources, I would use it more often. It's the sort of think you feel that actually, you can have someone go through and give a list of resources.

Although Charlie was enthusiastic about the possibility of using tablets in her teaching, the barrier of entry was too high for her at the start of the project. The lack of time to explore the resources, lack of knowledge and experience in using tablets, and the lack of opportunity to receive guidance prevented Charlie from adopting the tablet in her teaching.

Resources, in terms of software or hardware available to use tablets, was the most frequently discussed factor in the group meetings. Specifically, the resource the teachers were discussing was the funding to pay for apps. The teachers often discussed that they knew of apps that would be good for their class, but the fact that there was a fee, regardless how nominal, made it an inhibiting factor. The teachers discussed the dilemmas of paying for an app that would rarely be used, or the cost of having every student purchase a costlier app. There were also discussions about whether it would be useful to buy only one version of an app for the teacher and project it on the board. However, it was agreed that this would make any app much less useful if students could not use them individually. This issue of fees on apps raises an important issue for tablets in the classrooms. There needs to be a school policy or process for how much funds can be devoted to apps, and how to select which apps to pay for. It seemed to be an unspoken rule, that only free apps would be used unless special permission was granted by the school. This presents a logistical hurdle and possibly prevents the best software from being used on these powerful devices.

Lack of quality apps available, or not finding the type of app the teachers imagined being useful for a lesson, also became a central discussion. Without knowing of a specific app or resource, all the teachers imagined ways in which the tablets would help their class. Jordan captured the essence of this when she said that: "Sometimes we have an image but no app for it. Like in algebra with the balancing scales, but we don't have scales." But the frustration of not being able to find exactly what they were looking for became a major debilitating factor for the teachers. Jordan stated that "there's an equal measure of over and under abundance. There is an overabundance of some stuff." Not only is there a sea of resources that teachers need to search through, but what is available is disproportionately distributed to lower mathematical skills. The teachers talked about not being able to find resources for their higher achieving students in Year 8, when they saw many wonderful apps for younger grades, and also having some topics that they could find any apps for. Even when they did find apps they did not fit all the requirements they had, as Charlie describes her experience:

The interesting thing is that there are hundreds to choose from but when you start looking at them, they really don't do what you want them to do. They hit the surface but what we really need is to get to the conceptual bit. I didn't find anything that was the best, but I found something that would do. I went down the route of what if I paid a bit to get something better.

It became clear that having access to a curated list of useful resources would be essential for the teachers, but none of them have found a list of that type of material. There are certainly lists of the top ten best apps for this, or that, which can be found on some blogs or websites. Jordan did mention having found some apps on similar lists, but these lists are not well aligned to what the teachers are teaching, nor are they easy to find for topics they need them for. Rather than lists, what the teachers were describing was a customized curation that can be easily accessed for the topics they were teaching. Such a resource would greatly reduce the amount of time they were spending to find resources, and the barrier of entry for teachers who may not know what they are looking for.

Technical Issues concerns technical challenges with the hardware, software, or infrastructure faced by the teachers. This was one of the issues that was given by all teachers in each of the data collection methods. The issues ranged from insufficient infrastructure in terms of losing internet connection to the unpredictable nature of how apps work. Teachers expressed frustration at not being able to predict how the technology would work even when they prepared and practiced using it before the lesson. This unpredictable nature of the technology not only adds a lot of time to the preparation needed by teachers, but the extra work they spend on diligently preparing does not eliminate the disruption caused by the technology not working during the lesson. It is this unpredictability that was given by teachers as they reason that they have to prepare two lessons, one if using the technology and another traditional lesson in case the technology stopped working. Although this is a difficult factor to address, as there are many reasons for this unpredictability, but from the amount of frustration expressed by the teachers it is easy to see why this factor alone might hinder the initiative to use technology in the classroom. Possibly as technology advances, and the teachers and school become more accustomed to using the technology, these issues will subside, but this was a significant inhibiting factor expressed in this study.

Mathematics Misunderstood, refers to factors that have the characteristic of not fully understanding the needs of mathematics subject teaching and learning. One example given by Alex, was that the training provided for teachers did not address the teaching needs of mathematics subject teachers. The apps that were being taught to be used on the tablets were not relevant to mathematics teachers. Sam also mentioned that she, or the school overall, have not found really mathematics specific applications to use.

A lot of the conversation in the group meetings focused on was that mathematics teachers felt disconnected from other subjects and the leadership that was implementing the one-to-one tablet program in the school. "We do swim in a slightly different boat a lot of the time" stated Alex, to which everyone agreed. The professional development offered to the teachers seemed to miss the requirements that the subject of mathematics has. Jordan expressed frustration at the IT director, who tried to insist that all teachers try to be creative and use programs that make movies and collages as a way of engaging students. The mathematics teachers agreed that they could only do so much with these programs that do not offer any insight into the understanding of mathematics and on many occasions they found traditional lessons conveyed the learning more effectively. As an example, the teachers mentioned iMovie program as being highly recommended by school. The teachers said that they could see how this might be useful in other subjects such as history, but they could not do too much with this program. They said that although it might be captivating for the students to make a short movie demonstrating their understanding of a mathematical concept, their mathematical knowledge could not be pushed too far using such programs.

The teachers said that this disconnect was actually preventing them from using tablets at all and some of them have been using tablets significantly less than they did early on when the program was introduced. The narrow vision that the leadership was promoting was inhibiting subjects like mathematics. Rather it should have been recognized that mathematics has special needs. Sam suggested that if there were someone made responsible for finding applications specifically for mathematics, that would make a big difference in enabling the teachers to use tablets more widely and successfully.

Support provided to the teachers from the leadership or technical team was an important factor that was raised in different contexts. One important example that unfolded over the course of the study was Alex's experience. This is a significant example because Alex was very enthusiastic supporter of the tablets being introduced into the school. She was a young teacher who said that she was given a computer to use when she was in school as a learning aid because she has dyslexia. She said that the computer made a big difference in her learning and she was excited to use tablets to help her students learn better. But in the year since the tablets were introduced and this study began, Alex had almost altogether stopped using tablets for many reasons.

At the first group meeting Alex was very encouraged and enthusiastic about learning from the other teachers. Her enthusiasm sparked an idea, but the lack of support from school leadership was the factor that impacted her. In the first meeting, hearing the concerns other teachers had, Alex started getting an idea.

Alex: Just thinking about what these guys are saying. Jordan, imagine a world where you didn't have to research for digital worksheets that you could write your own. So I can write the questions that I want my class to answer

Jordan: Just a static question and they type in an answer?

Alex: Yes, they type in answer and then they know if it's write or wrong

Jordan: Maybe you can use Socrative so maybe it's worth us thinking about how we can do that and they can do it self-paced

Alex: But just listening to you I can't help thinking it would be great if we could create our own

Jordan: Yes yes!

From this one meeting, Alex picked up on a need that she and the other teachers were experiencing and already started to test her idea with the other teachers. She knew her boyfriend was a good programmer, so she asked for his help. Together, they designed the program and within a few weeks he made it. Alex was thrilled to see her idea coming to life and she knew this would be a great help for her and the other teachers. She describes the ins and outs of process when the other teachers inquired about when the program would be ready:

It's all there, it's all been written, I just can't get the IT department. It's just that classic thing. I went to finance and they said that before they pay for it, I need to go to IT and they need to sign off on it that it's for work. That was a long time ago. I even got IT manager involved and I said this is the way we want to go in math, and every week he said he will get back to me, but he still hasn't replied. This is the way IT department work, they get things done very quickly that they want to get done but not others.

It was not a matter of funding, as the license was quite inexpensive, and it was not a matter of other teachers not supporting her idea, because they were enthusiastically waiting for her program to be available. Yet, over the months of this study, Alex grew more and more frustrated at the hurdles she had to jump over. Before the tablets were taken back by the school, Alex was still trying to get the school to install this program, and may have continued to do so until she was successful, but all the tablets were recalled in the school. The lack of support Alex faced dampened an incredible turnaround in enthusiasm for the tablet program.

Management are factors that relate to decisions made by school leadership that impact teachers' use of tablets. Some of these decisions included what paid programs teachers had access to, whether students each had their own tablet or there were class sets, and the type of professional development is offered.

The teachers in this study had several management related factors. One example is that the school had decided to give one laptop to every study, that they were able to take home. The impact of this decision was that often students forgot to bring their tablets, did not have them charged, or did not load the apps that the teacher requested to be loaded for the day. The teachers often talked about how they came to prefer the idea of class sets, rather than a tablet for every child. The ownership that was it gave the students had the possibility of causing classroom disruptions. In several of the observed lessons in this study, it was noted that the teacher had to pass out her tablet, group students together for activities that were intended to be individual, and on occasion even hand out her personal smart phone because several students did not have their tablets. The trickle effect of this management decision to provide each student with a tablet caused unexpected inhibiting factors in the classroom.

Classroom management concerns, such as disruptions or students being distracted, caused by the use of tablets were given by teachers, often in connection to another factor. Some examples involve students being disruptive when a technology failure allowed for a pause in the lesson. The teachers were hesitant to use tablets in their less well behaved classes as they feared losing control over the class. To some extent this concern may be alleviated as everyone becomes more accustomed to using tablets, but a loss of control is significant as an important element of a teacher's job is to keep the class focused on the lesson.

Another example of classroom management factors relate to the example given previously about the students having ownership of their individual tablets. In one example Jordan talked about the compulsive ownership students had over their tablet, many having to physically touch the tablet even when it was not being used. Something she thinks might not be an issue if it were a class set. Teachers also complained that students had filled their tablets with games, did not remember their passwords, or were distracted by the programs they had on them. Although classroom management is a key concern for teachers even when there is no new technology introduced, any change or disruption does have the added impact of disrupting the flow of a class.

Knowledge Exchange addressing factors

Knowledge Exchange is defined in this study as conversations in which help was offered and knowledge was exchanged. It draws on the extensive literature that teaching networks, where teachers learning from each other, have been found to be extremely useful by many teachers in developing their professional practice (Trust et al., 2016; Dawson, 2012). In this study *Knowledge Exchange* is captured by counting each time help is offered and knowledge is exchanged between teachers, as defined in Table 3. By not capturing the context of the information exchanged, the focus is on the exchange between the teachers rather than judging or evaluating the help or knowledge being exchanged.

Table 3 Definition of knowledge exchange.

Knowledge exchange	Definition: Conversations in which help was offered or knowledge was exchanged. Example: Anne “after a week of searching for an app that would dynamically demonstrate the properties of a circle, I finally found one.” Tim “what is it called? I have been searching for one to use in my next class.” Anne “I’ll send it to you.” Example: Ken “I tried to use the graphing app on the tablets but I wasn’t able to graph more complex equations.” Sarah “I found a way to do that last week, let me show you.”
--------------------	---

Group meetings

All the teachers in this study expressed a great appreciation for having time to learn from each other. In her initial interview, Sam said would help her improve her practice was the opportunity to share and learn from her colleagues. Sam felt that it would be useful to learn how her colleagues dealt with difficult classroom management situations caused by the tablets as well as to get tips on the tools they found useful in their lessons. Unfortunately, she said that the nature of the school schedule does not give teachers the opportunity to share their learning, which she hopes the group meetings will provide.

The four group meetings quickly developed into dynamic discussion in which the teachers opened about their experiences using tablets, their worries, and shared their knowledge. In this learning network, the teachers exchanged many ideas on how to use the tables in the classroom, resources, and hands-on demonstrations to teach each other how to use the tables. At the start of the first group meeting the first author asked the teachers what they wanted to get from these group meetings. Unanimously they said that they wanted to get ideas and inspiration on how to use tablets. Jordan said that she also wanted to have shared experiences, where she got to talk to others who were further on in their practice of using tablets in certain ways. As she explained, everyone agreed, they were looking to learn from each other. Charlie added that she just wants to grow her confidence. When the first author asked her how this group will help with that, she said the following:

It’s quite nice that not everyone here is a real wizard. Because when you go to any of the training I just sit and feel completely and utterly overwhelmed. I watch it all going on and it’s like I’m not even in the room, I’m on the ceiling thinking oh my, I will never be able to do that. So it’s nice to hear that other people also feel that.

This speaks to the importance of the shared experience and understanding that was central to the design of the group meetings, which intend to create a professional learning network for the teachers. Everyone felt that they had a lot to learn about the use of tablets in teaching and although they had different levels of experiences in this, they also had something to share.

The open-ended structure of the meetings allowed for these conversations to grow and flow as the teachers felt it was necessary, allowing them to discuss the aspects of teaching with tablets that was most important and valuable to them. With this structure, general themes emerged for each meeting. The first meeting resulted in discussing the factors that impacted the teachers’ use of tables, the second meeting was focused on exchanging ideas on how to use the tablets, the third meeting was the most vibrant and rich in ideas on how tablets could be used and exchanging ideas and resources on using tablets. The fourth meeting focused on factors that impacted the use of tablets and reflecting on how tablets can be used, this was a more reflective conversation because the tablets had already been taken out of the school. It was an unplanned change in the school policy to turn the one-tablet-per-child program into classroom sets. The tablets were revoked from the school for several months to refurbish. Had there been an opportunity to have more meetings, it is possible that the teachers would have progressed to discussing ways in which the tablets could be used in increasingly more innovative ways. Unfortunately, the tablets were suddenly removed from the school before all the meetings could be completed.

All the teachers were very engaged in each of the meetings, and the conversations flowed with ease and ideas regularly grew bouncing from one person to the next. In terms of building knowledge, the third meeting was the most productive and vibrant. This hints at how rich, productive, and innovative these meetings could have become had the tablets not been removed from the school after the third meeting. However, the learning network that was created with these teachers during these meetings still had significant impact on their use and views of the tablets.

Addressing factors

The knowledge exchange conversations during the group meetings can be categorized in three distinct ways in which they address the factors that teachers were mentioning throughout the study, by sharing resources, providing support, and speaking the same language. Some factors were addressed by one or more of these categories, but these are the overarching themes of the conversations that addressed the factors. Each is described in more detail.

Sharing resources

Conversations where teachers shared useful resources in the apps or websites they were using or the strategies they incorporated in how to manage tablets in their lessons. One example of a strategy was when Alex shared that she always instructed students to have tablets face down on the desk to avoid distraction.

Providing support

Support was provided in a variety of ways, including sharing stories of similar challenges as well as giving hands on help on how to use a certain app or program. The group meetings often served as making the connections to enable further support to be provided after the group meetings. Often one teacher would offer to set up a time outside of the meeting to help another teacher learn to use a certain program.

Speaking the same language

Having the common ground of all participants in the group meeting being teachers in the same school, same subject, and same year group, provided a lot of opportunity to share valuable resources and provide support. The importance of having a common understanding of what they were each experiencing was often mentioned and also given as something missing in other professional development settings.

Although the four teachers were already colleagues in the same school, the time spent on discussing experiences and ideas created common ground. The first author rarely had to ask questions or direct the conversation because the four teachers easily built on each other's answers. There was a sense of understanding and camaraderie as they all shared the same goal of growing their practice in using tablets to teach Year 8 mathematics. By the end of the conversation there were ideas and resources being shared among the teachers, and some of them were making plans to meet at a later date so they could spend more time demonstrating to each other how to use certain programs on the tablet.

As the meeting came to an end, the first author wanted to understand what the teachers felt about having group meetings and participating in this project. She encouraged the teachers to be critical and give suggestions as the structure may help other teachers develop their own learning networks in their schools. The first author wanted to find out if, and how, these meetings impacted them. The teachers unanimously agreed that the meetings were extremely valuable to their development of using the tablets, and as Alex described in the first group meeting, she had stopped using the tablets altogether before joining my study. Some of the reasons why the teachers found this format useful are best described in their own words.

Jordan: It was a stimulus to think and try. It was like well it's coming up, if nothing else it was the fact that the meeting was coming up and required some thinking and planning. I like the idea of using an iPad, sometimes you get bogged down because it doesn't work.

Sam: And then it takes someone else to get inspired again.

Alex: I just enjoyed the dedicated contact, dedicated time to improving this, and being on a separate site and the lack of conversations I have on anything related to pedagogy, means that this was like ok for the next hour I get to think about this. Sometimes in my own teaching practice you just get a nugget. It might be a single phrase of something someone said that gave you the confidence to go and try it and then use it in your own way and push it forward.

Charlie: What I would say is that this was absolutely fundamental to me doing anything. If I hadn't come I wouldn't have tried. The main thing was that everyone was massively supportive and didn't make me feel like I was horrendous. Also, I think it's nice having a small group and everyone is not techy, well Jordan is. But in trainings here, everyone is going a million miles an hour showing things on the iPad and I can't keep up with it. Actually, I don't take much in.

As Charlie stated, the format of traditional professional development courses can be overwhelming and out of context for some people. Research has also shown that these forms of professional development are less effective than anticipated. This does not mean they should be eliminated. Having external professionals, who understand the technology and are avid users, can share a wealth of information that would be useful for teachers. But maybe that benefit is missed if those sessions are not supported by regular opportunities for teachers to discuss and share their understanding among themselves in these type of learning networks. Sam articulated this when she described what she thought would be helpful for the teachers moving forward in using tablets in their teaching.

What would really help and what would really be useful would be if we continued doing that and continued to meet. This is the only time we can focus on this. The shared document, ya it's great, but we need to look at it at the same time. We all need to be thinking at the same time and responding at the same time.

Having dedicated time is not the ultimate solution, but we would suggest it is the final piece in the puzzle that makes all the other great resources stick together, enabling teachers to use technology in the best way possible. This format, of having dedicated time for guided discussions, provides the glue and the spark, as Charlie summed up "Having these conversations sparked off the thinking. The individual discussions overlapped and sparked off together."

Discussion

Throughout this study, seven key factors emerged that contributed greatly to the teachers' considerations of how, and why, they used and viewed tablets in their teaching of mathematics. It became clear to us that the following two initiatives—creating learning networks in schools and curating tablet resources for teachers—may address the factors that teachers indicated as having an impact on the way they use of tablets in mathematics. With the teachers indicating a positive experience of having structured knowledge exchange meetings, implementing learning networks would continue that experience, as well as addressing some of the factors that emerged. The use of the TADT framework, that was developed in the study this paper is drawn, can be used as a tool to facilitate the learning networks among the teachers. Curating tablet resources for teachers would also address several of the factors that emerged, particularly the factors involving time, support, and resources. Together these two initiatives may address many of the challenges that teachers faced in using tablets to teach mathematics.

Creating learning networks in schools

Developing a learning network within a school, such as the group meetings used in this study, can be the glue that holds together all the other valuable resources and investments that schools make in the implementation of technology in teaching. Having a technology manager in the school, external professional development, and purchasing resources for the tablets, would all be more valuable if teachers had the opportunity to discuss their use, and experience of using technology in their teaching, and develop their skills. Having this type of forum allows teachers to process what they learned in professional development classes, help them learn to use the electronic resources that the school purchased, and discuss the benefits and opportunities of the initiatives introduced by the technology manager.

Through this study, it became clear that giving the opportunity for teachers to work together, to develop their use of tablets, greatly impacted how much they used the tablets, their level of innovation, and it also improved their self-efficacy. Alex and Charlie are good examples of this. Alex stopped using the tablets before this study started and Charlie never got the courage to start using the tablets. During the first group meeting Charlie and Alex spoke at length on why having a learning network would be valuable to them. This is one example of many in which teachers highlighted the value they saw from having dedicated time to discuss and learn from each other.

Charlie: When you go to any of the trainings I feel completely and utterly overwhelmed. I watch it all going on and I'm not in the room, I'm on the ceiling, and I'm watching it all going on and I'm thinking "oh my god I would never be able to do that". So it's just nice to be able to hear that not everything is absolute instant hit.

Alex: I am hoping through doing this I can spend some time literally in a room with people who are also trying to teach math with iPads because of my timetable this year I don't spend any time on this site and I teach in a vacuum. For me this is literally the time I get to interact with people and prioritize these thoughts.

Although there are many different professional learning networks online for teachers, fostering this type of network in a school provides many advantages. To begin with, it incorporates teachers who otherwise would not find such a network online. In order to participate in such an online community, someone would need a certain level of engagement with technology. Having this network within a school, includes everyone who wishes to participate, not only those who are more comfortable using technology.

Time is another factor that would greatly inhibit many teachers. As was found in the study, teachers are greatly restricted by the amount of time they have to prepare their lessons. Without easily accessible and pre-arranged group meetings, finding time to engage in online communities is unlikely to happen for many teachers.

Relevant context is another important reason to have learning networks for teachers in schools. As previously mentioned, different school contexts have different obstacles and opportunities in the way technology is used in the classroom. Having teachers from the same school, who know the same students, meet regularly and learn from each other, means that they have the same cultural reference and context in which they apply the technology. For all these reasons, having a learning network for teachers within a school can provide a glue for all the other resources that schools provide to support the technology used in teaching. Teachers can leverage their different skills and knowledge to each develop further their use of technology in teaching mathematics. Schools spend significant resources on technology, the supporting structures, and the professional development to train teachers to use the technology. Strategically leveraging the knowledge and imagination of the teachers in the school can make the difference between a successful integration of technology or wasting valuable investment on technology that will quickly fade into the back of the classroom. Providing the type of group meeting structure that was in this study, could be the glue that holds together all the other investments they have made in technology.

One important direction for future research would be to investigate how the group meetings could develop over time and how the knowledge exchanged in the meetings might impact the way teachers use technology. It would be valuable for future research to

incorporate more group meetings over a longer period, and for group meetings to also increasingly focus on specific mathematical topics. This may enable teachers to design innovative uses for tablets that can help students to interact with mathematics in ways that would not be possible without a tablet.

Curating tablet resources for teachers

The greatest factor inhibiting teachers' use of tablets in this study was resources. Everyone agreed that there was an abundance of resources available, but the concern was the quality, usability, price, and disparate sources of countless resources. This factor impacted the amount of time teachers had to spend to find what they needed and also the self-efficacy was hindered as they got lost in a sea of apps, webpages, and programs. When, during a group meeting, we tried to find an app to suit a particular need teachers were discussing, Charlie summed up the frustration teachers face in the when she said that apps are "incredibly time consuming to find. We probably just spend 15 min demonstrating that we are lost in a world of a million apps, or no apps."

Having a curated list of useful apps, websites, and programs that teachers can use was a desire expressed in different ways throughout the course of the study. The teachers have never found a good forum to curate material online, but they also expressed the need for this to be a role that the technology manager could fill. They particularly made it clear that it was critical for anyone who did this, to be very sensitive and knowledgeable about the specific subject needs. The challenge is to know what mathematics teachers need and have specific understanding of what features programs need to have.

Although the teachers specifically mentioned that they would like the technology manager to help them curate the apps available to them, this role could also be taken on by the software industry. It would be useful to have a reliable and well-informed resource where mathematics teachers could find programs that best suited the topic they were teaching. In addition to curation, it might also be beneficial to build into programs clear teaching guides that include the rationale for the design of the program that helps students learn mathematics. This type of guides may help teachers select programs more effectively and also learn ways of implementing them in their class. This type of material, that aims to promote teacher learning alongside student learning, is often referred to as *educative*. An example of such an educative material was used to help teachers teach proof in mathematics (Stylianides and Stylianides, 2014) by providing annotated PowerPoint slides with the annotations detailing what to do as well as why/how to do it. These types of instructions, included in programs and apps, could greatly aid teachers in how they use technology. This is only one part of the greater ecosystem required for integrating technology into teaching, which includes professional development, resources, and infrastructure, among others, but it could be a significant contribution to helping teachers find and use the resources they would like.

Conclusion

This study, by being situated in the natural school setting and focusing on the teacher, provides insights to help integrate technology into mathematics education in the school setting. By focusing on teachers with different levels of experience and comfort in using technology to teach mathematics, this study highlights the factors that impact their decisions when using tablets in their teaching of mathematics. Through regular group meetings that fostered a learning network, the teachers focused on reflection and exchanging knowledge about their use of tablets, and in this process their use tablets developed. These insights are hoped to inform future research and implementation of mobile devices in schools, as well as the implementation of ongoing learning networks in schools that may help teachers further develop their use of technology in mathematics education.

Introduction

Teachers have been shown to elicit the greatest impact of in-school variables on student outcomes (Hattie, 2009). Darling-Hammond (2000) noted that the effects of quality teaching on student outcomes are greater than associated with students' backgrounds. This impact may be positive or negative, and the effect of poor-quality teaching has shown to be debilitating and cumulative on the student outcomes (Darling-Hammond, 2000). Slater et al. (2012) noted that students had almost a 12-month difference in academic progression when being taught by a low-performing teacher compared with a high-performing teacher. As such, teacher and teaching quality and effectiveness have become critical components of school improvement.

There is an important distinction between teaching quality as defined by practice and instruction, and teacher quality as defined by personal attributes, competency, skill, and dispositions (Darling-Hammond, et al., 2012). There are extensive reviews and research on teaching quality, and many existing standards define quality teaching practices, however, there are comparatively few reviews of research on teacher quality.

While all teachers have their unique personalities and identities, until now it has not been clear what types of communication style, beliefs, attitudes, and personality attributes are common among high-quality teachers, and therefore contribute to more

effective teaching. It is also unclear how and how much the teacher as a person relates to teaching practice, and thence to student outcomes. This review aims to explore these key characteristics of effective teachers and consider the juxtaposition of teacher and teaching quality.

Methodology

Given the complexity and inconsistency in the use of terminology related to teacher effectiveness, a systematic review appears an appropriate method to explore the influence of teacher attributes. The research strategies employed in this review utilised a search strategy that included a combination of database-specific subject headings and natural language keywords. Strategies used reflect Cochrane systematic review recommendations to identify as many relevant records as possible, with searches comprising a combination of subject terms selected from the controlled vocabulary or thesaurus ("exploded" where appropriate) with a wide range of free-text terms.

Inclusion criteria employed during the source screening phase of the review included the country in which the study was conducted, type of study, teacher variables, and association with outcomes of interest (such as student learning outcomes). To ensure that the findings of the review were based on relevant quality evidence, the review only included studies on teacher evaluation tools that were published in the last 10 years, between 2008 and 2018. Considering the breadth of studies that were included in this review, a quality assessment approach was created for different studies. Two quality appraisal checklists were used: The Grading of Recommendations Assessment, Development and Evaluation [GRADE] and the Critical Appraisal Skills Programme of Qualitative Studies [CASP]. Screened sources meeting the inclusion criteria were fully reviewed in detail, and data were extracted and coded to identify teacher characteristics and the impact and strength of the relationship, or association between these characteristics with the outcomes of interest. Where available statistical data including measures of outcomes in teacher quality and student learning were extracted to investigate the impact of teacher characteristics on specific outcomes of interest. Qualitative data were also extracted following specific coding categories and procedures.

Studies reviewed

Of the 12,317 articles across twelve databases, identified through the application of the search strategies, only 52 met the inclusion criteria. As illustrated by the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-analyses) diagram (Fig. 1), most sources ($n = 10,982$) were excluded at the initial abstract screening stage as they did not meet the inclusion criteria of discussing teacher characteristics or were not primary research studies. Most of the included sources utilised qualitative research designs ($n = 23$), with the majority being classified as narrative reviews ($n = 12$). Only four of the included articles were systematic reviews or meta-analyses.

Quality assessment of reviewed studies

GRADE and an adaptation of the CASP checklist were used to assess the quality of the 52 included studies. Based on the CASP quality assessment, all qualitative studies were deemed of sufficient quality to be included in the review. For the quantitative reviewed studies, the quality assessment using GRADE indicated that across all studies there were no serious limitations based on the study design and results presented. However, the quantitative studies varied considerably in quality which was largely explained by differences in the depth of information reported, and the measures conducted (or not) to address sources of bias. In light of these results, the specific effect size estimates should be interpreted with some caution, however the GRADE quality assessment findings were not concerning enough to warrant exclusion of the four quantitative studies included in the meta-analysis.

Characteristics of effective teachers

A total of 11 teacher characteristics were identified through the analytic process. These characteristics were cognition, social and emotional competence, self-efficacy, communication, motivation, cultural competence, personality, self-reflection, collegiality, attitudes, beliefs, expectations, values, morals, and ethics. Evidence for each of these is summarized in the accompanying tables and judgments about whether there is a direct or indirect relationship between the characteristic and effectiveness outcomes (teaching quality and student learning) are made based on the systematically reviewed evidence.

Cognition

Cognition was defined as the teachers' creativity, critical thinking, and competence. Of the 52 included studies, five investigated teacher characteristics associated with cognition and how they relate to teaching quality outcomes, including managing student behavior and developing inclusive education environments. Overall, the studies synthesized utilized a range of review designs and were of moderate to high quality based on the CASP and GRADE criteria. Teacher cognition was minimally addressed in the reviewed primary sources, however its related aspects of creativity and teacher credibility were explored in greater detail. Based

Fig. 1 PRISMA diagram.

on the review of primary sources, creativity is considered an attribute that is broadly useful and significant for teacher effectiveness (Table 1).

Social and emotional competence

This was defined by five core SEL competencies (also referred to throughout as SEC) that comprise this characteristic and included self-awareness, self-management, social awareness, relationship skills, and responsible decision-making (Table 2). Of the 52 included studies, six investigated the importance and relationship between *teacher social social-emotional learning and competency* and student outcomes including student learning, school climate, and teacher outcomes. The studies synthesized utilized varied study designs and were of varying quality based on the CASP and GRADE criteria (2018; 2013). Based on the synthesis of six studies

Table 1 Cognition.

	Direct/indirect	Effect size (Cohen's d) & qualitative findings/direction of the relationship
Teacher ability to teach children with behavioral problems	Direct 	Teacher creativity, imagination, insight, and openness were related to their ability to teach children with behavioral problems and manage behavior within a mainstream classroom. $d = 0.35$
Classroom management	Direct 	
Community building/collaboration	Direct 	Creative, open, and imaginative teachers are more likely to engage in efforts to build communities of practice and collaborate with more and less experienced educators to learn. Open and creative teachers tend to promote inclusivity in their classroom readily.
Inclusive education	Direct 	
Student-centered teaching	Direct 	$d = 0.36$
Teacher judgment, decision making & student achievement	Direct 	$d = 0.63$ Teachers who adopt more evidence-informed judgments improved student achievement.

Table 2 Social and emotional competence.

	Direct/indirect	Effect size (Cohen's d) & qualitative findings/direction of the relationship
Student relationships	Direct 	$d = 0.52$
Relationships with other teachers/colleagues	Direct 	SEC improves teachers' relationship building with colleagues.
Relationships with the broader school community	Direct 	SEC improves teachers' relationship building with parents, caregivers, and the broader community.
Teacher personal wellbeing	Indirect 	High SEC teachers tend to report greater personal wellbeing.
Student social and emotional learning	Indirect 	High SEC teachers have a greater capacity to implement SEL programs in the classroom.
Student achievement	Indirect 	High SEC teachers who implement SEL in their classroom tend to promote more positive development which can improve academic performance.
Student behavior	Indirect 	$d = 0.56$ High SEC teachers promoting more positive development in the classroom can help manage student behavioral problems and promote social capital.

in this area, SEC of the teacher is a characteristic that is related to teacher quality, which is correlated to known outcomes that are causally related to student achievement, and this is particularly notable for the contribution of teacher's SEL to the development of beneficial student-teacher relationships (Hattie, 2018).

Self-efficacy

This is a teacher's belief in his or her innate ability or capability to organize and execute the courses of action required to manage prospective situations and have a high impact on student learning (Table 3). Eight of the 52 included sources that investigated the relationship between *teacher self-efficacy* and outcomes. Overall, the studies synthesized displayed a combination of systematic and narrative designs as detailed below. The quality of studies varied based on the CASP criteria with a combination of high and moderate-quality reviews. Two discussion papers were judged to be of poor quality, largely due to insufficient reporting of study design, analyses, and the process for review of primary research (2018; 2013). Based on the synthesis, teacher self-efficacy can be considered a teacher characteristic that is related to teacher quality, including student achievement, and has a large effect on student self-efficacy (Visible Learning, 2017). In comparison to the studies synthesized that discuss other identified characteristics, the evidence for teacher self-efficacy is of high quality, and there is sufficient evidence to suggest that teacher self-efficacy is an important characteristic for teachers, teacher practice, and student learning.

Table 3 Self efficacy.

	Direct/indirect	Effect size (Cohen's d) & qualitative findings/direction of the relationship
Student expectations	Indirect 	Linked with teacher expectations. Teachers with high TSE tend to have high expectations of students and in turn influence students' expectations of their ability.
Student motivation	Indirect 	$d = 0.42$
Student self-efficacy	Indirect 	$d = 0.92$
Student achievement [teacher self-efficacy & student achievement]	Indirect 	$d = 0.21$ (0.22) Teachers with high TSE have been positively associated with student achievement in STEM areas.
Classroom management	Direct 	$d = 0.35$ High TSE is associated with classroom practices, particularly in managing problem behavior, and promoting a cohesive environment.
Teacher wellbeing	Direct 	High TSE is associated with teacher wellbeing, particularly in terms of confidence and resilience to coping with stress.
Teacher expectations of students	Direct 	$d = 0.43$ (0.08)
Inquiry-based teaching	Direct 	$d = 0.40$ Teachers with high TSE tend to promote student participation and discussion in the classroom, and therefore inquiry-based learning.

Communication

Communication is the act of transmitting information and includes verbal and non-verbal types of communication such as communication style, body language, appearance, and instructional communication (Table 4). Across the reviewed sources, there appears to be strong evidence for the importance of communication in influencing teacher pedagogy and practice, and ultimately student learning outcomes. Eight papers described the importance of communication as a characteristic of effective teachers. Most of these papers were qualitative study designs, although communication was also explored in two of the meta-analyses. Collectively, the evidence suggested communication is a critical characteristic of effective teaching, “decades of research leave no doubt that communication is central to the teaching-learning process” (Webster, 2010, p. 33). Based on the synthesis, communication can be considered a teacher characteristic that is related to outcomes of interest, which is correlated to known outcomes that are causally related to student achievement, namely student-teacher relationships (Hattie, 2018).

Motivation

Generally, motivation is defined as the drive that influences behavior; there are various dimensions of motivation theory including intrinsic motivation and self-determination theory (Table 5). When considering teacher motivation with other identified characteristics, there was variable evidence found for motivation. This conclusion, however, is based on only one qualitative source that focused on teacher motivation as a key teacher characteristic. Han and Yin (2016) conducted a literature review focused on the “abundance of approaches to explain motivation” (p. 12), aiming to conceptualize a framework for further research. This review was graded as moderate-high quality. Overall, teacher motivation is linked with student outcomes, Teacher motivation can be understood through self-determination theory, which also correlates with identified demotivating factors, such as lack of autonomy.

Cultural competence

This is awareness of one’s cultural competence and views on diversity, and one’s ability to successfully teach students who identify with a culture or cultures other than those of the teacher (Table 6). One article among the 52 included studies discussed cultural competence. Cultural competence was found to both *directly* and *indirectly*, impact student learning and other outcomes. Porter-Samuels (2013) described the importance of cultural responsiveness specifically concerning Māori and Pasifika students in a New Zealand context. Based on the review of secondary and supplementary research literature, cultural competence is an important characteristic for creating an empathetic, caring classroom environment, for all students and especially for minority students or students whose background does not necessarily match the teaching methods and culture(s) of their teachers.

Table 4 Communication.

	Direct/indirect	Effect size (Cohen's d) & qualitative findings/direction of relationship
Student achievement [clarity]	Indirect	$d = 0.75$
Student achievement [verbal ability]	Indirect	$d = 0.22$
Student motivation	Direct	Relational and rhetorical communication techniques can allow teachers to increase their communication effectiveness, and subsequently increase student motivation in class.
Positive classroom/school climate	Direct	Communication plays an important role in promoting positive home-school relationships and a positive classroom climate

Table 5 Motivation.

	Direct/indirect	Effect size/qualitative findings
Student achievement	Indirect <pre> graph LR A((A)) --> B((B)) B((B)) --> C((C)) A((A)) -.-> C((C)) </pre>	Teacher motivation is linked with student learning through enhancing classroom effectiveness (positive classroom climate for learning)

Table 6 Cultural competence.

	Direct/indirect	Effect size (Cohen's d) & qualitative findings/direction of the relationship
Student relationships	Direct <pre> graph LR A((A)) --> B((B)) </pre>	Culturally responsive teachers can build a stronger rapport with students from culturally diverse backgrounds.
Student engagement	Indirect <pre> graph LR A((A)) --> B((B)) B((B)) --> C((C)) A((A)) -.-> C((C)) </pre>	Cultural responsiveness can increase student engagement, through the inclusion of culturally relevant materials.
Classroom climate	Direct <pre> graph LR A((A)) --> B((B)) </pre>	Culturally responsive teachers can create “culture of care,” an inclusive, caring, and supportive environment.

Personality

This is the combination of those characteristics or qualities that make up an individual's character (Table 7). There are several models of personality, most notably the five-factor model of personality which includes: extraversion, agreeableness, openness to experience, conscientiousness, and neuroticism. A total of eight articles included in the review examined personality. There was variance in the strength of the evidence among the eight articles. While not directly observable in a teaching and learning context, the evidence base suggests personality and certain dispositions such as extraversion have been linked to positive classroom behaviors, and can influence student learning outcomes. Empirical studies illustrate that personality factors are related to teaching behaviors and practice that in turn impact students, in both affective outcomes and cognitive outcomes. While there is limited effect size information, Hattie (2018) suggests the magnitude of the influence of personality on student outcomes is quite small. This is likely due to the distal nature of the relationship, where personality is expressed through teacher behavior and practice, which in turn influence student outcomes (Hattie, 2018). There are few dimensions of teacher personality systematically related to achievement effects, and at best there are indirect effects on other attributes (as noted in Fig. 3). From the breakdown in Table 7, positive effects on student achievement relate to teacher's personal confidence in themselves, demonstrating enthusiasm for the job, and those most able to identify and make judgments about situations. The other personality factors have low to zero correlations with student achievement.

Self-reflection and reflection

This relates to a teacher's reflective processes in identifying their strengths and weaknesses in their teaching practice, and their ability to adapt or correct them accordingly (Table 8). Three articles within the review examined the impact of self-reflection and reflection on teaching practice with one. Narrative review rated with moderate to high evidence strength. Teacher self-reflection is an important tool that is closely linked to teacher self-efficacy. The belief in one's capabilities to execute a course of action, to manage prospective situations requires the teacher to assess their own past experiences to inform their future decisions and practice. Self-reflection, therefore, is correlated with quality teaching practice. Teacher self-reflection and its relationship with student outcomes are not particularly comprehensively explored in the reviewed studies. However, there was consensus across reviewed literature that teacher self-reflection is influential on teaching practice and therefore is an important teacher characteristic.

Table 7 Personality.

	Direct/indirect	Effect size (Cohen's <i>d</i>) & qualitative findings/direction of relationship
Classroom management	Direct 	Personality traits, such as extraversion have been linked to positive classroom behaviors, and reduced reports of aggression and negative behaviors in children.
Student affect	Direct 	Teacher's personality traits were found to impact student affect and emotions.
Student motivation	Direct 	Teacher's personality traits were found to impact student motivation and engagement.
Communication	Direct 	Teacher's personality traits were found to impact teacher's communication styles and practices.
Teacher attitudes and beliefs	Direct 	Personality is related to the attitudes and beliefs that teachers have about students and their learning.
Student achievement	Indirect 	Teacher personality attributes are indirectly related to student achievements, $d = 0.25$. This relationship is mediated by other characteristics, such as confidence and knowledge.
Student achievement	Indirect 	Certain personality types may be more willing to engage in self-reflection and adaptive teaching strategies, ultimately improving student learning outcomes.
Student engagement	Direct 	All five personality dimensions (except for neuroticism) had a positive relationship with a teacher's ability to engage students with behavioral problems.

Collegiality

Collegiality defines the cooperative relationship between teachers and their colleagues, and in this context the collaborative nature, encouragement, and optimization of peers, especially with teacher leaders (Table 9). Of the 52 reviewed studies, three investigated teacher characteristics associated with collegiality, leadership, and community and their respective relationship with student outcomes. The studies reviewed included a narrative review and two theoretical commentaries, which were of poor to moderate quality based on the CASP criteria (2018). Collegiality and the constructs within this category have several direct and indirect relationships with student outcomes. Collegiality is also linked to other characteristics, such as teacher self-efficacy and self-reflection. Based on the synthesis of reviewed research, collegiality can be considered a characteristic that is related to outcomes of interest, however, more high-quality empirical research is required to definitively conclude that collegiality is important for student learning.

Table 8 Self-reflection and reflection.

	Direct/indirect	Effect size (Cohen's <i>d</i>) & qualitative findings/direction of the relationship
Student achievement	Indirect 	Reflective practices are linked to student learning outcomes, as teachers adapt their classroom practices to better meet the needs of their students.

Table 9 Collegiality.

	Direct/indirect	Effect size (Cohen's <i>d</i>) & qualitative findings/direction of a relationship
Social capital	Direct 	Teacher social capital and information sharing, as well as trust, are directly related through collegiality and the illustration of these characteristics through the development of professional learning communities.
Co- or team-teaching	Direct 	$d = 0.19$ Collegiality encourages the implementation of co or team-teaching, more collaborative teaching, and educators are encouraged to observe colleagues teaching.
Student-centered teaching	Direct 	$d = 0.36$

Attitudes, beliefs & expectations

This is a teachers' belief in the importance of accomplished teaching and the learning and achievement potential of all students (Table 10). Of the 52 included studies, six investigated teacher characteristics associated with attitudes, beliefs, and expectations and their respective relationships with student outcomes. Teacher attitudes, beliefs, and expectations have both direct and indirect relationships with outcomes for students and the classroom learning environment. However, the strength of evidence varied considerably among the studies synthesized. Based on the synthesis of six secondary studies, teacher attitudes, beliefs, and expectations can be considered a characteristic that is related to student learning. However, it is noted that the evidence for some outcomes, for instance, student cognitive learning, is of poor quality and therefore the relationship between this characteristic and student learning should be interpreted with some caution. However, isolating the effects for goal setting and teacher expectations specifically, which are large and reflected in multiple sources synthesized, the evidence is strong (Hattie, 2012). Overall, there is sufficient evidence to

Table 10 Attitudes, beliefs and expectations.

	Direct/indirect	Effect size (Cohen's <i>d</i> , Fisher's <i>Z</i> [<i>r</i>]) & qualitative findings/direction of the relationship
Teacher expectations	Direct 	$d = 0.43$ Teacher expectations of their teaching ability and the capability of their students have an impact on student achievement.
Teacher goal-setting for students	Direct 	$d = 0.59$ Teachers who hold positive attitudes, beliefs, and high expectations tend to set regular goals for their students that align with an ambitious achievement vision. This goal-setting has an impact on student achievement.
Student cognitive learning	Indirect 	$r = 0.05$ Teacher beliefs and expectations about their students' learning have an impact on cognitive learning outcomes.
Student confidence	Indirect 	Teacher beliefs and expectations when aligned to a positive view of the learning potential of students can increase student confidence in their learning.
Student motivation and affective learning	Indirect 	$d = 0.44$ $r = 0.01$ Teacher beliefs and expectations about their students' learning have an impact on affective learning outcomes.

indicate that teacher attitudes, beliefs, and expectations are important characteristics as they support the establishment of a learning environment that encourages students to progress in their learning and work towards achieving their potential.

Values, morals and ethics

Teacher values can be defined as the beliefs and virtues that teachers may hold about issues, such as religion or environmental sustainability, and extend to a teacher's ethics and morality. Surprisingly, the characteristics of values, morals and ethics did not emerge from the literature reviewed. Given that it is considered an important dimension of a teacher's character in policy and resources relating to teacher standards, an additional search for supplementary evidence was conducted and yielded 52 results. Nine documents were analyzed of varying significance and quality regarding the value, moral, and ethical dimensions of teacher characteristics and its influence on student learning outcomes. No empirical evidence was found in reviewed studies however, the targeted review of supplementary research illustrated the ways in which teachers' values, morals and ethical position can influence their teaching practice, and relationships with their students. As with areas such as personality and cognition, teacher values, morals and ethics may have a more distal relationship to outcomes of interest but could be an important mechanism through which other characteristics are expressed, for instance, communication could be influenced by teacher values, morals, and ethics. More high-quality empirical research is needed to investigate and evaluate these mechanisms in more depth to make a definitive conclusion about the importance of teacher values, morals, and ethical position for teaching practice, student, and school outcomes (Table 11).

Summary

The evidence for the identified teacher characteristics is considered to be of moderate strength and quality. While some characteristics were evidenced by a large number of reviewed articles, such as self-efficacy and communication, others had very few articles providing evidence, such as motivation, collegiality, self-reflection, cognitive capability, and cultural competence. These characteristics were supplemented with a further search for primary or supplementary sources, which increased the breadth of literature for those characteristics (Table 11). Note that Values, morals and ethics are not included in the table due to insufficient evidence.

The 11 teacher characteristics identified together influence a wide range of outcomes categorized as student, teacher, or school outcomes. These influences can be either direct or indirect. Student outcomes are perhaps the most common and visible of the outcomes, as teacher practice is generally geared toward the end goal of student achievement. Some characteristics directly influence student outcomes such as student engagement, student affect, and student motivation; teacher characteristics that directly influence these outcomes include personality, cultural competence, communication. It is more common, however, for teacher characteristics to exert influence over student outcomes indirectly; this may be because teacher characteristics influence teaching practice, which in turn affects student experiences and achievement. All characteristics, except for collegiality, indirectly influence at least one student outcome.

Teacher outcomes include outcomes that affect the teacher as an instructor, for example, teacher wellbeing or teacher expectations of students. Classroom outcomes are an extension of teacher outcomes but are treated separately here to distinguish between the teacher as an instructor and the classroom as an instructional environment. Teacher characteristics generally have a direct influence over classroom outcomes. For example, teacher self-efficacy has a direct effect on teacher wellbeing, teacher expectations of students, classroom management, and inquiry-based teaching. All characteristics, except for motivation, directly or indirectly influence at least one classroom outcome.

School outcomes take a broader perspective and tend to apply to the school as a system. Despite the complex nature of schools, the identified school outcomes are under the direct influence of the teacher characteristics. Characteristics such as communication,

Table 11 Summary of findings of characteristics.

Characteristic	Number of primary/supplementary sources providing		Strength of evidence
	Number of secondary sources	evidence	
Cognitive capability	5	152	Moderate
Social and emotional learning/competence	6	N/A	Moderate
Self-efficacy	8	570	Moderate-high
Communication	8	233	Low-moderate
Attitudes, beliefs, and expectations	6	381	Moderate
Motivation	4	12	Moderate
Cultural competence	1	8	Moderate
Personality	8	61	Moderate
Self-reflection and reflection	3	5	Low
Collegiality	3	5	Moderate
Total	52	1427	Moderate

social and emotional learning, and cognitive capability all have a direct influence on school outcomes, including school climate, relationships with colleagues and the wider school community, and inclusive education.

The relational map of teacher characteristics illustrates a summary view of the key connection and outcomes (Fig. 2).

A model of teacher effectiveness

The findings from a review of the literature provides an opportunity to postulate a model that outlines the process in which the characteristics relate to each other and ultimately impact student, teacher, and school outcomes. The model is an attempt to make meaning of the characteristics identified in the systematic review and those lacking from the evidence base. It draws on many integral and well-established relationships; however, we do not suggest that the systematic review findings alone provide explicit, specific evidence for the construction and design of this model. More empirical evidence would enable the categorization of characteristics and order of the relationships to be tested.

It is suggested that the characteristics can be ordered to reflect a relational process. As such, there have been changes to the characteristic groupings presented in the results, to ensure that the characteristics align with the overarching dimension categories. Importantly, this process is underpinned by context and the specific teaching and learning environment, as well as contextual factors related to the individual teacher (e.g., career stage). Therefore, it must be considered as a dynamic and interactive model, which varies across teachers, time, and place. It is suggested that there are trait and state dimensions of teacher behavior that interact with the teaching environment. These are mediated by capability, attitudes and beliefs that in turn manifest behaviors (Fig. 3).

Trait dimensions

Trait aspects of a teacher's character are those personality variables that relate to extraversion, openness, conscientiousness, neuroticism, and agreeableness. These are those factors that are often hidden from sight, but which are relatively stable throughout one's life span. It is these elements that make up the character of a person and often influence thoughts, behaviors, and emotions. Hence, they are often thought of as inherent and distinguishing. While the evidence regarding the impact of these personality variables on teaching is not strong, they are often seen as characteristics that predict the communication and behavior of the teacher. Furthermore, there is strong evidence in the psychology literature that these traits and personality constructs relate to a number of the psychosocial constructs highlighted within the model, such as self-awareness and self-efficacy (Brown and Cinamon, 2016; Strecher et al., 1986; Lord et al., 1986). In the model, these trait variables are considered central to the teacher characteristics that facilitate effective teaching. However, we acknowledge that they may not always be measurable.

State dimensions

We have used the term "state dimensions" as a means of describing those characteristics of a teacher that are movable, dynamic, and dependent on certain contexts. State characteristics are often defined as temporary behaviors or feelings that depend on a person's situation, mood and motivations at a particular time and in a particular context. In this case, these psychosocial resources, such as

Fig. 2 A relational map of teacher characteristics.

Fig. 3 Model of teacher characteristics.

self-esteem and self-efficacy, are those characteristics that are particularly influenced by the context of teaching. We acknowledge that these are intrinsically related to all personality variables but are more especially relevant to the context of teaching. The model demonstrates key dimensions concerning the self, one's social and emotional competency, and the cognitive dimensions relating to such characteristics as critical thinking and creativity.

The psychosocial characteristics related to the self

These are characteristics that are individual and often relate to social situations. Self-efficacy, regulation, and concept awareness are thought to have beneficial effects on mental and physical health outcomes. In the case of teachers, it is well documented that teacher self-efficacy is related to job satisfaction, wellbeing and teacher retention (Klassen and Chiu, 2010; Caprara et al., 2003, 2006; Skaalvik and Skaalvik, 2010).

Social and emotional competency

This refers to the skills that help individuals to interact in positive ways with others and manage their emotions. These skills are varied and include, among others, relationships skills and social sensitivity. These are extrinsically related to the self and cognitive variables.

Fig. 4 The relationship between teaching and the teacher.

Cognitive characteristics

These characteristics relate to factors such as creativity, openness, decision-making, or inquisitiveness. The model suggests that there is a strong interaction between the self, social and emotional competency, and cognitive characteristics. These individual dimensions, or a combination of these dimensions, come to the fore in various situations and contexts, for example, when working collaboratively with colleagues on an innovative teaching initiative.

Capability dimensions

The next level of dimensions relates to a teacher's capacity to engage in evaluative thinking, cultural competency, and commitment to and motivation for teaching. These dimensions are defined as capabilities in that they encompass the ability to demonstrate a certain behavior or characteristic. In essence, a capability or skill relating to oneself can be learned and developed.

Cultural competence

The idea of cultural competence relates to three characteristics: the awareness, knowledge, and skill to act appropriately and competently in specific cultural situations.

Commitment and motivation

These capabilities allow for a teacher to demonstrate a level of commitment and the motivation to understand and further education in a variety of settings.

Critical reflection

Critical reflection is a collective of characteristics that allow a teacher to review and modify their practice in a particular setting through the process of evaluative thinking (Yost et al., 2000).

Attitudes, beliefs, expectations

The model then suggests that trait, state, and capability dimensions relate to teaching and consequently shape a range of individual attitudes, beliefs, and expectations as a teacher. In the reviewed literature there was little evidence to distinguish clearly between attitudes and beliefs. There is, however, a strong literature base relating teacher expectations to student outcomes. Closely associated with attitudes, beliefs, and expectations are the morals and ethics that define values often held by teachers. These characteristics were not specifically identified in the systematic review; however, it is a widely discussed area within the standards of behavior for teachers. We suspect this dimension relates to the affective nature of teachers and draws on many of the personal characteristics and the contexts that teachers often find themselves in. Further analysis and research on this dimension are necessary.

Behavioral dimensions

The final level of dimensions within the model relates to projected behaviors: how a teacher communicates; their level of collegiality, for example, their collective efficacy working within teams and school contexts; and finally, the professional image and competence they project. These key aspects of this dimension are those most easily and appropriately evaluated.

Communication

This specifically relates to the skills and behaviors that a teacher may use in a variety of situations to communicate, for example, classroom discourse.

Collegiality

Collegiality relates to the professional, collaborative relationships a teacher may have or how they may project their professionalism to their peers.

Competence

Competence is the confident and skillful image projected by a teacher, or, in other words, behaving and acting as a teacher competently and confidently.

Understanding the juxtaposition between effective teachers and teaching

The current study has focused on teacher attributes as a dimension of effective teaching, as this was an area requiring more fine-grained analysis. As a result of an increased understanding of the dimensions that comprise effective teaching, the conceptual model has been developed to illustrate the nature of the interactions between all dimensions and their impact on a school community, and student learning. Within this overall model, we have been able to determine the significance of the cognitive component of the teacher characteristics. In the model, a higher-order structure is presented where several dimensions are highly related and influence

students, teachers, school climate, parents, and community. This current synthesis has afforded the exploration of the relationships within the model. As previously suggested, this is not a linear structure given the complexity of teaching and learning, however, there is evidence to suggest that many dimensions are related to specific outcomes for students as well as community and school climate. Furthermore, many dimensions interact to mediate influence on these outcomes as indicated in the figure above.

Understanding effective teachers and teaching

Fig. 4 illustrates that there are several key characteristics that a teacher brings to the classroom including knowledge and personal attributes. These attributes include knowledge, mindsets, life experiences, personality, and dispositions. It is suggested that many of these characteristics relate to a person's behavior as a teacher. This behavior and its ensuing outcomes are mediated by a collective of cognitive constructs that can be thought of as evaluative thinking. It is suggested that teachers use internal processes that draw on their knowledge, skill, and personal characteristics to make decisions about a way of behaving. It is this way of behaving concerning teaching, instruction, communication, and interpersonal relationships that ultimately influences the education community.

The importance of a teacher's thought processes has been investigated by many. Hattie (2012) suggests that all teachers are evaluators and are constantly engaging in a process of evaluating their impact. Teachers' thinking processes or cognitive skills have been demonstrated as a significant construct in influencing decisions that teachers make in planning and determining how to adapt their lessons for different students within their charge. Risko et al. (2005) go one step further to describe these characteristics as "overlapping constructs that involve deliberate, evaluative, and constructive activity." These meta-cognitive components of teaching can be thought of as evaluative thinking.

Evaluative thinking stems from the discipline of evaluation and is considered a cognitive construct. That Tom Archibald defines as:

Evaluative Thinking is a cognitive process in the context of evaluation, motivated by an attitude of inquisitiveness and a belief in the value of the evidence, that involves skills such as identifying assumptions, posing thoughtful questions, pursuing deeper understanding through reflection and perspective-taking and making informed decisions in preparation for action.

Archibald (2013).

Further, Patton (2008) suggests it is a way of thinking that infuses everything. The idea of evaluative thinking has a strong synergy with education as it describes that an element of effective teaching is a way of knowledge, decision-making and agility in the application of knowledge and decision-making to the context of a classroom. Wyatt (2017) suggests that "Evaluative thinking is a disciplined approach to inquiry and reflective practice that helps us make sound judgments using good evidence, as a matter of habit" (2017, p. 79). Wyatt goes on to demonstrate how the disciplines of evaluative thinking are woven throughout the school planning process (NSW Department of Education, 2018; Wyatt, 2017). We suggest that it is the synthesis of understanding, knowledge, skill, mindset and the self as a teacher to enact behavior that creates an impact. Within this proposed model of effective teaching, evaluative thinking is the mediator or the conduit between the teacher and teaching.

A final word

This systematic review has concentrated on those cognitive and non-cognitive characteristics of teachers that are thought to have an impact on or influence the school community, in particular, students. It is but one element of the model of effective teachers (Clinton et al., 2017).

The synthesis was devised to progress our understanding of the complex world of teachers and ultimately attempt to predict their impact. Sources of evidence for this rapid review have primarily derived from secondary research sources such as meta-analyses. Systematically reviewing the evidence in this way has allowed us to develop our understanding of those fundamental characteristics of the teacher that are significant. The depth and breadth of the evidence that emerged from the review in itself reveals the state of the research on the characteristics of teachers. There are many gaps and quality is variable.

The overall model of the path of teacher characteristics is derived from the triangulation of evidence extracted from reviewed secondary sources. It is an attempt to demonstrate how certain characteristics relate to or influence others and importantly how we might see some of these characteristics manifest in behavior.

Acknowledgment

This work was funded by a research grant from the Australian Government Department of Education and Training.

Glossary

Terms important in understanding the tenuous relationships between the Arts and education and teacher education as discussed in this article include:

Arts and education is an overarching term emphasizing equal status and acknowledging a reciprocal and interactive relationship.

Arts in education and education through the Arts capture the concepts of engaging in arts experiences and using arts processes and strategies as pedagogical tools to facilitate learning and foster creative and flexible thinking connecting different kinds of knowledge

Education in the Arts and arts education describe the teaching and learning *about* different arts disciplines

quality in arts learning experiences manifest all-encompassing engagement; involvement with authentic, artistic processes and materials; an exploration of “big ideas” about both art and human experience; and direct experiences with completed or in-process works of art (Seidel et al., 2009)

Teacher education refers to both initial or pre-service education needed to gain a qualification to teach as well as ongoing professional learning for experienced teachers

Teaching Artist defined by Booth (2010/2020) as a person who is “... a practicing professional artist ... who can effectively engage a wide range of people in learning experiences in, through, and about the arts” (para 5)

Introduction

Arts education matters because people trained in the arts play a significant role in the innovation process the arts are an essential part of human heritage and of what makes us human, and it is difficult to imagine an education for better lives without arts education.

(Winner et al., 2013, p. 13–14)

The Arts are as old as humanity because they are central to who we are as human beings: they connect to our imaginations and creative and expressive capacities. Reflect for a moment on the emotional way we respond to a moving orchestral, dance, film, a theater performance or an artwork; the curiosity or wonder triggered by an imaginative arts process or experience; our expanded capacity for empathy and compassion on identifying with a compelling fictional character in a novel; and the personal satisfaction that arises when we find a way to express a challenge or dilemma provocatively through one or several artforms.

Research and scholarly writing over the last three decades have unequivocally supported the imperative of embedding the Arts throughout our lives to ensure our social and emotional wellbeing (for example, *A New Approach*, 2020; *World Health Organisation*, 2019). The Arts are important for who we are and must never be viewed solely as “instrumental” to the achievement of other learning outcomes (McCarthy et al., 2004).

Nevertheless, in the education context, it is increasingly clear from international research and practice that engaging teachers and learners in quality arts processes and experiences fosters imaginative learning and creative thinking (Martin et al., 2013; Gibson and Ewing, 2020; Ewing 2010), transforms outdated transmissive curricula (for example, Burnard and Colucci-Gray, 2020), enriches our understanding of ourselves (Eisner, 2002), enables us to develop compassion for others (Biesta, 2013) and provides new possibilities for the way we live in our global communities (Greene, 1995).

This article first explains the use of the term “The Arts” and provides a brief snapshot of relevant research before arguing that pre-service and ongoing in-service teacher education should be arts-rich – both in specific arts disciplines and as critical, quality pedagogy (Ewing, 2002, 2006, 2019) across the curriculum. All teachers must have the confidence and expertise to provide quality arts learning experiences in their classrooms at all levels of education. Some of the major challenges and tensions that frequently obstruct the realization of this proposal are then discussed. Finally, current opportunities are considered through several contemporary teacher education initiatives.

Defining “the arts”

Cultural and social contexts shape and sustain and, conversely, inhibit the flourishing of different arts disciplines (Bamford, 2006) in different communities. Conscious of the ever-changing nature of contemporary arts experiences and practices, the term “the Arts” has been used throughout this article as a collective, shorthand term to refer to major creative arts disciplines and the embodied knowing they develop. The following arts disciplines are named in many formal curriculum documents all over the world and are the key artforms for the Arts referred to in this article:

- Dance involves moving the body expressively and intentionally to make meaning, represent, question and celebrate experience.
- Drama employs dramatic elements and processes to create and explore roles, characters, relationships as well as actual and fictional worlds.
- Literature includes imaginative novels, short stories, plays, poetry and picture books that use evocative, expressive language to explore and communicate experiences, perspectives and ideas.
- Media arts incorporate traditional and new technologies to tell stories creatively and includes, for example, photography, film, video and digital animation.
- Music is aurally based and involves listening, composing, performing and critical appreciation.
- Visual arts includes two- and three-dimensional design and art-making (painting, drawing and sculpture) to communicate, challenge, express and appreciate ideas.

Each arts discipline represents different ways of knowing (Habermas, 1972), making meaning and communicating about ourselves, others and the world, and so each embodies a different literacy (NAAE, 2019). All art forms must therefore be studied, understood and appreciated for their intrinsic worth (Bryce et al., 2004), discrete knowledges, understandings and skills. At the same time, all art forms involve processes that clearly resonate with creative dispositions and 21st century skills (National Education Association, 2013; Jefferson and Anderson, 2017; Gibson and Ewing, 2020). These processes include imaginative play; experimentation or exploration; provocation; use of metaphor; expression or representation; communication; design; and the artistic or esthetic shaping of the body or other media (Ewing, 2010). Teachers need to embed these processes and acknowledge how they are inextricably linked to both their own already rich imaginative and creative abilities and the nurturing of their learners’ social and emotional wellbeing and academic success.

While the knowledge about discrete disciplines of art-making processes must be upheld, this author strongly believes that artistic and educational collaborations should also be based on authentic interdisciplinary and multidisciplinary explorations (Harris and Carter, 2021; Gibson and Ewing, 2020; Bresler, 2004). It is damaging when competitive arguments about which arts discipline should receive the most attention dominate the educational agenda. Interdisciplinary, organic, ways of thinking about the Arts have the potential to provide a much-needed shift in epistemological grounding (Gadsden, 2008).

Developing teacher confidence and expertise in different artforms is insufficient, however, if pre-service and experienced teachers do not understand and celebrate their own artistry as educators. For the Arts to play an important role in formal educational contexts it is imperative that both pre-service and well-established teachers see their teaching as artful. In the author’s experience, teachers sometimes describe themselves as “uncreative” or “not artistic”, and are unaware of the esthetic (Hobbs, 2012) that underpins their teaching.

A brief snapshot of relevant research

Decades of international research have highlighted the potential role that the Arts can and should play across early childhood, elementary, secondary and tertiary education to motivate and engage learners (Fleming et al., 2016) as well as to enhance their social and emotional wellbeing and identity development that, in turn, ensures improvement in academic achievements more generally (for example, Saunders, 2019; Catterall, 2013, 2009; Deasy, 2002). Quality arts processes and experiences are inextricably

linked to the development of dispositions/habits of mind that are critical for successfully living with post-normal (Sarder, 2010) 21st century uncertainties (for example, Gibson and Ewing, 2020; Winner et al., 2013; Ewing, 2019; 2010; Bamford, 2006; UNESCO, 2006; Miller and Saxton, 2016, 2004) and improve our achievement in other academic areas.

Findings from a range of research and practitioner sources over more than two decades demonstrate that the Arts, while in no way the solution for all educational and social problems, have the potential to help us address many of the habitual issues routinely embedded in current educational institutions. These include the motivation and engagement of young people in authentic learning (Wyn, 2009) and the inequities of the competitive academic curriculum (Connell, 1994). Many successful arts projects also depict the Arts as providing potential catalysts for social transformation in the community more generally (for example, see 25 years of projects coordinated by Big hArt, <https://www.bighart.org/what-we-do/past-projects/>).

Arts-rich experiences can give teachers and students the courage to make and represent meanings aesthetically (Greene, 1978), to take risks and fail memorably (Zusak, 2014) to genuinely collaborate (Heath, 2000), and, critically, to develop the resilience to try again (O'Connor et al., 2020). The process of creating or responding to an artwork, a theater or dance performance, a piece of music, a film or writing a story, can trigger the asking of big questions that inevitably challenge the stereotypes that prevail too often within individual and community life. Experiencing and engaging in quality arts processes and experiences are therefore necessary for all children and young people as part of their everyday learning – through these processes they gain access not only to the real world but to other possible imaginative worlds, and begin to make coherent meanings about their own identities, their worlds and the others in these worlds.

Increasingly, neuro-scientific research confirms that genuine collaborative strategies developed through creative dance, music, visual arts and drama activities can achieve an increase in brain synchrony encouraging the breaking up of old patterns of behavior (Damasio, 2004; Freeman, 1995). The ability to empathize or walk in someone else's shoes emphasized in educational drama is also important in understanding diversity and the need to be inclusive (O'Toole and Dunn, 2020; Karaolis, 2020; Dunn et al., 2019, 2020; Campbell and Hogan, 2019; Donelan, 2012; Heath, 2000).

Thousands of arts and education programs and initiatives all over the world strive to improve educational outcomes or change problematic social situations through embedding arts experiences in formal or informal learning contexts (A New Approach, 2020; Ewing, 2010). Too numerous to mention, these programs and initiatives have varying specific goals and objectives primarily concerned with improving the life chances of children or adults considered to be vulnerable or "at risk". Given the growing research evidence about the centrality of the Arts for cognitive and emotional well-being and the impact it can have on deep learning, arts education needs to be seen as a core curriculum component and be accessible to all students from all backgrounds at each level of education. Yet, despite the importance of such programs to their participants and their potential generalized social impact, many of them are initiated and implemented by not-for-profit, philanthropic organisations rather than education departments.

Despite growing evidence that the Arts can initiate curriculum reform, provision of arts education and education through the arts professional learning for pre-service and experienced teachers has been continually cut alongside funding for many arts organisations in western countries over the last three decades. While specialist arts secondary teachers usually qualify through a first degree in their chosen arts field(s), this article particularly highlights the need for *all* teacher education courses to incorporate meaningful education about, in and through the Arts.

Almost in contradiction to the rhetoric that proclaims the importance of the Arts and their relationship to creativity, problem solving and flexibility, neoliberal government policies seek linear recipes for success in literacies defined in very reductive ways (Darling-Hammond, 2010) through assessment of achievement based on high-stakes testing (Nussbaum, 2010).

Although the Arts are flourishing in some countries, including Wales, Finland and Singapore, they have been radically cut in others. In Australia for example, the pandemic saw many Creative Arts Degrees and professional learning programs cut across the country. Resource funding for quality arts education in schools has historically been unevenly applied and distributed and consequently, and even more so since COVID-19. It is often the most vulnerable school communities that miss out-as many advantaged schools can ask parents to pay for extra-curricular arts programs and experiences – when those who are disadvantaged are the ones that need these experiences the most (Vinson and Rawsthorne, 2015; Ewing, 2010).

Acknowledging the value of arts education in developing creativity emphasizes the importance of the interdisciplinary nature of key competencies, including cultural awareness (Harris and Carter, 2021). They represent an important lens through which to view the Arts in teacher education (President's Committee on the Arts and Humanities, 2011; Council of the European Union's Agenda for Culture, 2007).

The following section highlights several examples where the Arts has been foregrounded as a core curriculum component in schools alongside the provision of ongoing teacher education.

Embedding the creative arts as a core formal curriculum component: exemplars

Despite the trends mentioned above, there are a number of countries where arts in education has been prioritized to ensure it is a core curriculum component and where teacher professional learning needs have been addressed. Several examples are highlighted briefly below.

Wales

In 2015 the need for the centrality of the Arts in the formal Welsh curriculum was recognized and has been actioned by the Welsh government over the last few years (Welsh Government, 2015). *Successful Futures* (Donaldson, 2015) reviewed curriculum and assessment in Wales building on an earlier report (Smith, 2013) to strongly endorse the recommendation to place arts and creativity at the heart of the Welsh curriculum. Expressive Arts is now one of six “areas of learning and experience” in the Welsh national curriculum for ages 3–16 adopted in place of traditional, often silo-ed curriculum subjects. The report recommended that the entirety of the school curriculum should be designed to help all children and young people become:

- ambitious, capable learners, ready to learn throughout their lives
- enterprising, creative contributors, ready to play a full part in life and work
- ethical, informed citizens of Wales and the world, ready to be citizens of Wales and the world
- healthy, confident individuals, ready to lead fulfilling lives as valued members of society.

In the Expressive Arts curriculum, it is intended that learners develop their creative appreciation and talent, and their artistic and performance skills. It spans the making, performance, expression and appreciation of art, drama, music, dance, film and digital media and “many opportunities” are provided for students to visit theaters and galleries. Funding is available to bring artists and musicians into the classroom. The *All Wales Arts and Education Program* supports the partnerships between artists, creative and heritage organisations and schools by building bridges to support teachers and enrich arts teaching and experiences across the curriculum in schools. Professional development events for teachers “focus on contemporary arts practices and historic arts and culture to equip expressive arts teachers with confidence to present and respond to the professional practice of artists and creative practitioners”. “Arts Champions” visit school and cultural venues to mentor expressive arts teachers. See <https://nawr.cymru/creative-learning/>.

Finland

In Finland, regarded as a world leader educationally, the Arts also have traditionally played an important role in both school and cultural life. This is often attributed to the influence of the concept of the Scandinavian folk schools. Finland education authorities have long considered the Arts in education vital across their system. Interestingly there has not been the same privileging of STEM (science, technology, engineering, and mathematics) over the arts as has been the case in many other western countries. The Finnish Ministry (2010), acutely aware of the inequitable distribution of artforms and arts resources across different regions, implemented strategies to widen the opportunities for children to pursue artistic interests, notably by establishing a network of 11 children’s cultural centers.

Singapore

In Singapore over the last decade there has been a stronger and explicit focus on the importance of quality arts experiences for all students across the formal mainstream curriculum from preschool to the conclusion of secondary school. There is also an emphasis on providing greater opportunities for sustained partnerships between Singapore artists and arts educators in school to deepen their creative practices and increase learners’ engagement in and through the Arts. Professional learning initiatives have been developed to support both artists and teachers.

Yet there are many other examples worldwide where the arts in-and-through education are not flourishing despite the policy rhetoric. The following section considers some of the ongoing challenges and tensions that continue to work against ensuring all teachers are well prepared to embed the Arts in learning.

Challenges and tensions for teacher education in the arts

The challenges and tensions for teacher education in the Arts continually recur in any conversations about arts and education. Although these are inter-related, they are briefly discussed separately below:

1. A perception that arts disciplines represent a form of cultural elitism and are only accessible to the privileged. The persistence of the continuing hierarchy of curriculum subjects in many neoliberal western education systems – with the most notable priorities being narrow understandings of literacy and numeracy often measured by high stakes tests (Barton and Ewing, 2017). Competitive academic curricula (Connell, 1994) is often the main “passport” for entering tertiary education. It also underlines that the Arts are often still regarded as elite or as a “soft” or extra-curricular offering rather than core to a child’s emotional and social wellbeing and academic success.
2. In many western education systems, teachers are constantly exhorted to improve literacy and numeracy test results rather than to focus on a rich integration of curriculum areas. Winner et al. reported in 2013 that the share of time allocated for arts education for children aged between 9 and 11 has diminished in 10 of the 18 OECD nations. This observation is supported by evidence from individual countries:

- i) The [University of Warwick Report \(2015\)](#) argued that between 2003 and 2011 there was evidence that the Arts and creative processes were progressively being “squeezed out” of the English curriculum.
 - ii) In the United States of America the *No child left behind Act (2001)* has been blamed for diminished arts offerings in many public schools. In 2014 The US National Center for Education reported a huge decline of the arts in public schools with six percent of public elementary schools (serving 1.3 million students) failing to offer music, 17% (serving nearly 4 million students) not offering visual arts and ninety-seven percent of public elementary schools (serving 23 million students) not offering any instruction in dance or theater. The secondary public school offerings are not much better with 88% (18 million students) excluding dance and 55% theater.
 - iii) In Australia in 2020, the then federal Education minister recently flagged a review of what he described as “the crowded curriculum” calling for a return to the core subjects of mathematics and English. In a news report he bemoaned the sacrifice of “quality over quantity” and called for a concentration on “essential content” expressing wariness of so called “soft skills”, of “problem solving, critical thinking, creativity and teamwork” ([Hunter, 2011](#)). Pervasive attitudes like these also contribute to a regime of standardized testing that denies a focus on more creative approaches to teaching and learning.
 - iv) In South Africa [Vermeulen’s \(2009\)](#) doctoral research found that few teachers had expertise in more than one arts discipline and that practical arts activities were often sacrificed for more literacy and numeracy instruction.
 - v) For thousands of years in China, Confucianism provided a basis for a holistic approach to Chinese Arts education. “Six Arts” (etiquette, music, archery, charioteering, calligraphy and mathematics) were emphasized from early childhood. The *Annual Report of Chinese Arts Education (2012)* foregrounds music and visual arts as the main components of preschool arts education ([Li, 2013](#); [Zhang, 2012](#)). Some Chinese educators suggest there is a biased focus on a skills-only approach to teaching in the Arts and claim that many children are expected to follow the teacher’s instruction while more spontaneous exploration and appreciation are ignored ([Tau, 2019](#); [Zhang, 2012](#)).
3. The literary arts are often pitted against other arts disciplines ([Barton and Ewing, 2017](#)) and often excluded from the arts syllabus documents (even though they are usually an important component of English syllabi). This is another example of the lack of attention to interdisciplinary studies. There are therefore ongoing tensions between the Arts and literacy – in fact they are sometimes conceived as competing for curriculum time, resources and physical space.
- Allocated time for the Arts in pre-service teacher education and professional learning programs in many countries has continued to be cut over several decades. Inadequate or almost non-existent pre- and in-service teacher education and professional learning in the Arts for early childhood, elementary and non-arts secondary teachers has resulted in many teachers articulating a lacking of confidence and expertise to embed the Arts in their pedagogy in one or more artforms ([Ewing and Saunders, 2016](#)) suggesting there is little chance for Arts pedagogy to improve. At Murdoch University in Western Australia, for example, elementary pre-service teachers have just 6 hours in their program to learn about the Creative Arts ([Pascoe, 2015](#)). Reduced time allocation for learning about specific arts disciplines in teacher education courses has resulted in many early-career teachers reporting that they lack the knowledge, skills and understanding in one or more of the art forms that they are expected to teach. Additionally some research suggests that pre-service teachers do not always see the relevance of the Arts (see, for example, [Lemon and Garvis, 2013](#)) for their classrooms.
4. In many schools’ arts activities can be “soul destroying and meaningless”, lacking in depth and dimension ([Boyd, 2009](#)).
 5. At times intense political and often destructive arguments within and between the arts disciplines themselves ([Pascoe, 2015](#)) have created other kinds of tensions. The paucity of funding for arts and education programs has contributed to some re-emergence of fragmentation and competition between different art forms as they fight for the meagre dollars available, with the consequent assertion that some arts disciplines are more important than others (e.g. [Thomson and Sefton-Green, 2011](#)).
 6. The assessment of esthetic knowledge is complex for schools and teachers, because it is wholistic engaging the brain, body and emotions simultaneously in a range of symbolic languages and forms. Current traditional assessment systems concentrate on those cognitive aspects of knowledge that can be made explicit and learned propositionally, just in words or numbers.
 7. Increasing pressure for schools to include the study of new media (including film, photography and digital arts) in their curricula, and to enable students to use ICT as part of the creative process is also costly and very often not viable for some less advantaged schools, privileging once again those students whose parents can afford to pay for additional teachers.
 8. Misconceptions about teaching arts disciplines continue. One such misconception is the deeply held perception that being able to do or teach an art form requires special innate gifts only attainable by, or given to, a chosen few. Such feelings are sometimes influenced by unfortunate prior personal arts experiences in the educators’ own learning journeys.
 9. There is also evidence of a mismatch between what is expected of early childhood and generalist elementary teachers in teaching about, in and through the Arts and what they themselves believe they can do ([Alter et al., 2009](#); [Garvis and Riek, 2010](#)).
 10. While there is much correlational evidence about quality arts and the improvement of student learning across the curriculum, more systematic large-scale research quantifying their impact ([Ewing, 2010](#)) in ways preferred by governments is needed.

Although policy rhetoric often values the place of the Arts in curricula, there needs to be ongoing and sustained teacher education in the Arts, adequate resourcing, teacher professional learning and prioritizing if the Arts are to take their rightful place in schools and

other learning institutions including universities. The next section particularly focuses on the need for teachers to understand their own artistry as educators.

Understanding teaching as artistry

As mentioned above, often generalist early childhood, elementary and non-arts secondary teachers at all stages of their careers articulate a lack of confidence and expertise in teaching different art forms (Gibson and Ewing, 2020; Uptis et al., 2010). Many bring baggage from childhood experiences that have affected their confidence with one or more artforms.

In addition to developing knowledge and expertise about the teaching of mandated arts disciplines in early childhood and elementary contexts, teachers must see their teaching as artistry and become aware of the role the Arts and arts processes can play in enriching their creative pedagogical perspectives in their curriculum area(s). As Dinham (2019) argues, all pre-service and experienced teachers need the time and resources within their teacher education to engage in learning through the Arts and to reflect on these experiences. They need to be challenged to think creatively about their own teaching and the esthetics of teaching.

Offering innovative units of study that encourage early-career teachers to engage in Creative Arts experiences empowers them to be actively involved in designing their learning against a backdrop of traditional transmissive educational practices commonplace in many institutions of higher education. Young teachers need to see meaningful connections across the Creative Arts and experience different routes of learning that can be accessed through the Creative Arts.

If early-career teachers are to feel empowered to change transmissive and traditional educational practices that often exist in schools, it is vital that they acknowledge, understand and question their own emerging teacher identity and many taken-for-granted aspects of teaching practice. More than a decade ago Ewing and Gibson (2007/2015) documented a then five year journey to design and develop two elective final year Bachelor of Education Creative Arts units. These aimed to encourage final year pre-service elementary teachers to teach creatively through integrated arts processes and experiences. It was demonstrated that, through such processes, early career teachers reconnected with their own creative potential. Engaging in meaningful artistic creative processes helped them consider different ways of learning, understand the importance of the Arts for all learners and inspired them to offer similar learning opportunities for the children they subsequently taught.

This section has emphasized the importance of quality education in and through the Arts, and has highlighted the insecurities many teachers articulate about their ability to use arts processes in their teaching. Governments and universities must re-consider the initial preparation of all teachers to give them confidence to embed the Arts in their teaching and learning practices. Funding for ongoing professional development to enable both experienced generalist and arts teachers to continue to update their knowledge, expertise and skills in embedding the Arts in learning, and to undertake their own research and reflection on the impact of the Arts as pedagogy should also be prioritised.

The next section looks at some innovative teacher professional learning initiatives which suggest broader potential opportunities.

Opportunities

As demonstrated earlier, provision of quality teacher preparation in the Arts for early-career early childhood, elementary and non-arts secondary teachers has diminished and ongoing professional learning in the Arts has been almost non-existent. It has therefore been necessary for arts teachers, artists and teaching artists (Booth, 2010) to find innovative ways to share their skills and expertise by working collaboratively across universities, schools and the broader community. Many such initiatives involve teaching artists and artists-in-residence programs shared with community arts organisations, galleries and museums to underpin and support sustained teacher education in the Arts. This has been termed a co-participative approach (Nilson et al., 2013). Where possible the involvement of families in developing creative arts skills and interest is also developed.

Uptis et al. (2010) examined four North American professional programs aimed at upskilling generalist teachers in the Arts. While a number of teachers reported personal transformations, others reported that they experienced increased self-confidence and a greater awareness of their creativity and self-expression as well as moments of frustration. In many instances participants made a long-term commitment to the Arts in their classrooms and shared these new understandings with their students' parents. In Canada, masterclasses, teacher resources and internships for emerging artists are funded by *Arts Alive* (ArtsAlive.ca) established by the National Youth and Education Trust.

In the United Kingdom, *The Creative Partnerships Program* (2002–11) aimed to develop the arts skills and knowledge of more than a million young people and 90,000 teachers across England by funding 8000 innovative partnerships between creative professionals and schools. Many were long term and aimed to raise the aspirations of young people to give them more options for their future. Improvements in student attendance, engagement, behavior and academic achievement were documented (Thomson and Sefton-Green, 2011). Looking particularly at teacher professional learning, researchers noted that, for significant and effective professional learning to occur, teachers needed to go beyond the application of skills learned to understand the deeper underlying principles of the processes so they could generate their own planning and implementation of this work subsequently (Hatcher, 2011).

Most recently a very comprehensive longitudinal research project was conducted by the [Arts Council, England \(2019\)](#). The Royal Shakespeare Company (RSC), TATE and the University of Nottingham partnered to investigate the benefits of arts and cultural education for students and their teachers from 2015–2018. *Tracking Arts Learning and Engagement* (TALE) listened to the voices and opinions of young people aged between 14 and 18. [Cole and Thomson \(2021\)](#) analyzed students' responses as well as those of 63 teachers to provide new understandings about and insights into why sustained engagement with arts and cultural education makes such a difference. The clear overall message from students was that arts and cultural learning fosters their imaginations and creative intuitions as well as their self-efficacy in ways that other learning does not. The TALE project also investigated the different but successful models of continuing professional learning for teachers offered by Tate and the RSC.

The Kennedy Center in Washington DC has offered a variety of arts teacher education programs, *Changing Education through the Arts* (CETA) since 1976 aiming to enable all teachers to ensure the Arts are an integral part of every child's education. These intensive professional development programs are designed to teach educators about the Arts and about arts integration techniques. They include mentoring and co-teaching by expert teaching artists in the classroom. CETA partners with schools that have determined a school-wide integrated focus on the Arts and concentrates on teacher professional learning. It aims to: establish and nurture a network of schools committed to arts integration as an approach to teaching and learning; build teacher planning, teaching and assessment skills and practices in arts integration; create supportive school cultures that enable sustained teacher professional learning and collaboration; and share knowledge with other organisations with similar programs. Evaluations of CETA to date have reported that participant teachers nurture their own creativity as well as knowledge, skills and appreciation of the Arts and become more confident in working collaboratively to meaningfully connect art forms with other curriculum subjects ([Silverstein et al., 2010](#)). Similarly the [Lincoln Centre](#) in New York offers *Activate* programs that include speakers, immersive workshops and mentoring that connect arts professionals with the education community.

In Australia there are also many teacher professional learning programs involving artists-in-residence in schools that aim to develop teacher knowledge, expertise and confidence in embedding the Arts in the curriculum ([Hunter, 2005, 2011](#)).

Y-Connect was a unique three year (2016–18) government funded multi-arts project partnership between Griffith University and Yeronga State High School, a multicultural Queensland school with students from over 60 countries including a significant proportion from refugee backgrounds ([Dunn et al., 2019](#)). It aimed to support students' learning and sense of belonging by using arts-based pedagogy across the curriculum. Artists and artist-teachers partnered with teachers to deliver both classroom-based learning and extra-curricular activities. Six case studies have been developed to exemplify the outcome. One focuses on the impact of the project on both mainstream and English as an Additional Language/Dialect students. Another examines small groups of newly arrived year 10 students who are using drama based approaches to learning English. As the project lead researcher, Julie Dunn, reported:

Maths lessons involving dance artists, English lessons co-taught by actors and playwrights, students singing and composing with Opera Queensland or doing acrobatic tricks with Circa Circus team members, there is no such thing as a normal school day for students at Yeronga State High School ... In the 21st century, finding ways to engage young people in learning is always a challenge, so we are very pleased to report the energising impact the project has had on student learning and the flow-on effect this has had on their academic achievement.

(Dunn et al., 2019).

Since 2009 the Sydney Theater Company (STC) in partnership with The University of Sydney, has developed and implemented a teacher professional learning program, the *School Drama Program*. This program fosters teacher confidence and expertise in the use of drama processes with quality literature to enhance student identity, empathy and compassion as well as deepening their English and literacy skills. It is based on and extends [Ewing's \(2002, 2006\)](#) academic co-mentoring work with teachers over 17 years at Sydney's Curl Curl North Public School.

In the Classic form of *School Drama*, actors or teaching artists work alongside participant elementary teachers in their classrooms over seven weeks, modeling the use of educational drama as a powerful medium for improving students' English and literacy learning ([Ewing and Saunders, 2016, 2017](#)). At the heart of the program is ongoing teacher professional learning and a co-mentoring relationship between elementary teachers and experienced actors that re-awakens the teachers' own artistry. Using drama strategies to improve student engagement in a selected area of English and literacy, in turn improves the overall learning outcomes of students ([Ewing et al., 2015; Saunders, 2015, 2019](#)). The program now reaches all education sectors in every Australian state. Two of the pilot study schools remain involved in the program more than a decade later. All participant teachers and actors are initially involved in 3 h professional learning workshop so they experience the drama strategies and conventions first hand and reflect on how they apply to language and literacy learning. In addition principals and executive are encouraged to participate in these initial workshops.

The teaching artist and class teacher then plan and team teach a seven week program to meet the selected English and literacy outcome(s) incorporating relevant drama strategies and authentic literary texts. Each weekly session spans 60–90 min and after each session the teacher and teaching artist engage in a short debriefing session. Benchmarking of the students' capacities in the identified literacy area occurs before and after the program to assess student starting points and progress over the program. Pre- and post-program surveys are conducted with teachers and debriefing focus sessions are undertaken with teaching artists after each program. A meta-analysis ([Gibson and Smith, 2013](#)) and twelve case studies have been undertaken ([Karaolis, 2020; Beaumont, 2020;](#)

Saunders, 2015, 2019; McAtamney, 2018; Hankus 2016; Smith, 2014; Sze, 2013; Robertson, 2010) to explore various aspects of the program. At the time of writing nearly 35,000 teachers and their students had been involved in the program.

It has been critical to monitor the sustainability of such professional learning over an extended time frame. A variety of methods have been used to collect data from principals and executive staff, teachers, students and teaching artists to ensure that all participant voices and perspectives are heard. It does appear that this program is an innovative way of developing transformative teacher professional practice as well as deep literacy learning understanding for students. To date, based on information collected and analyzed, it is clear that the co-mentoring model is a highly effective professional learning approach. Both teachers and teaching artists express surprise at how valuable it is for them as well as the participating students. Teachers certainly value the distinction between building expertise and confidence through co-teaching and learning rather than, as in some artist in residence programs, a program that emphasizes *learning from* an expert. Teachers consolidate their learning between and beyond the teaching artists' visits. This has been shown to be at the heart of the creative transformation of teachers' practice. The teaching artists are also surprised by the depth of the new learnings and understandings of using their craft and expertise in this way.

Teachers consistently report improved engagement, empathy and confidence as well as literacy outcomes for their students. They note as well as a growth in their own confidence, understanding and expertise in using drama strategies in their programming across the curriculum. They frequently acknowledge a growth in or a return to their own creative pedagogical processes. The research findings also underline that the participant teachers' excitement with and enthusiasm for being associated with a working theater and professional actors alongside their new-found expertise in their use of drama.

Genuine collaboration between the teacher and teaching artist is both critical for and central to enabling and empowering teacher knowledge, understanding and confidence. Working together, learning from each other and sharing new ideas grows experience and expertise, and professional dialogue nurtures the development of authentic learning communities. With such opportunities, teachers can build courage and capacity to meaningfully embed drama in both their literacy program and across other subjects in the curriculum, and to articulate these philosophies and processes in their school communities.

It is also clear that teachers who have been involved in the *School Drama* program continue to use the drama strategies modeled for them in their subsequent English and literacy programs indicating the sustainability of the processes. Both text (Ewing and Saunders, 2016) and online resources (Ewing and Saunders, *The School Drama Companion*, 2016b) have been developed and the *School Drama Hub* professional learning program has been created to address the demand from teachers who have been involved in the Classic program to continue their professional development and involvement in the learning community. Attending twilight workshops to learn more, trying their learning out in their specific contexts and reporting back in the next workshop enables both a consolidation of skills and understandings as well as renewal. New units of work are jointly written and shared.

Further indications of the success of *School Drama* include its adaptation for use in intensive English classes in secondary schools for EALD students (Beaumont, 2020; McAtamney, 2018); in juvenile justice centers for disengaged students; in adult English classes for refugees (Hogan, 2020; Campbell and Hogan, 2019) and in early childhood contexts (Karaolis, 2020).

Teacher education and arts professional learning during the pandemic

Most recently crises including the pandemic and the increasing number of global crises like earthquake, bushfires and floods exacerbated by climate change have seen a number of very successful arts informed professional learning programs developed to help teachers work with children as they return to school following major traumatic and life threatening events. Arts processes provide powerful strategies to engender hope and restore wellbeing after disaster. *Te Rito Toi*, for example, was founded by Peter O'Connor in New Zealand drawing on his experience after the Christchurch and Mexico earthquakes. It now provides resources and support for teachers all over the world (<https://www.teritotoi.org>). Another example *The Banksia Initiative* <https://www.artshealthnetwork.com.au/about-the-banksia-initiative-recovering-rebuilding-reimagining/> was a cross disciplinary alliance of researchers, educators and artists to support Australian classroom teachers and communities as they recovered from the bushfires.

Core to the success of arts informed teacher professional learning programs are the respect for the teacher's artistry and professionalism. Bentley's (2015) key features of an effective professional learning framework have been reinterpreted by Abbey MacDonald (2018) for arts professional learning and are relevant here. The framework's features include time for consultation, planning and debriefing around shared purpose and vision; the forging of a genuine partnership and the development of collegiality and trust to learn from each other. Most important is the recognition of the intertwining of teacher, artist and student wellbeing, a growth in confidence and, consequently, a growth in identified knowledges, skills and understandings. Such programs also inform teacher (and learner) self-efficacy and the development of positive beliefs about how arts education and education through the Arts can be realized. Mentoring needs to be envisioned for all art forms and funding needs to be provided by the educator sector to augment the funding provided by arts foundations and philanthropists.

Concluding comments

If arts education is to be made accessible to all students from all backgrounds at each level of education, there are direct implications for teacher education and for school curricula. Because many official curriculum documents fail to emphasize arts processes and experiences, many teacher education programs do not provide adequate time and resourcing in arts education. If a creative culture is to be developed through arts education among teachers, principals and other leaders, governments and education systems must

reshape the competing competitive academic discourse that currently works against achieving such a culture. Cultivating imagination and creativity needs to become meaningfully integrated with other espoused priorities. Interdisciplinary experiences, including digital and other emerging art forms, need to be deemed important, not marginalized. More cross-curricular work involving arts and other (non-arts) subject areas, working together on creative and/or cultural themes, such as domestic violence, the refugee crisis, the environment and sustainable development, global citizenship and the need for peace, would initially place new demands on teachers and schools. It would require both intelligent school leadership and support at a policy level as well as adequate funding. The Arts are demonstrably well-placed to facilitate change in educational systems and structures. Communicating the individual and social impact of arts education, to raise community awareness about the intrinsic benefits of the Arts is also imperative.

A considerable and growing body of research supports the assertion that the Arts should be playing an important role in all areas of school and university education and community development. This cannot be actualized until there is adequate teacher education in and through the Arts.

All learners are entitled to access knowledge and skills that will enable their well-being in such a rapidly changing world. Nevertheless the position of the Arts in teacher education is under threat or already diminishing in many countries. With notable exceptions, it appears that in many education systems some art forms are encouraged (usually music and visual arts) while others are seen as optional, including dance and drama. In a crowded curriculum, and with worldwide cuts to education spending, minimal attention and funding is being provided for meaningful education in and through the Arts, limiting children's opportunities and experience in music, drama, creative writing and quality literature. We must research the impact of teacher education programs that do embed quality arts education and processes on both the teachers themselves and their students. If we are to realize the transformative potential of the Arts and education, we must move beyond rhetoric in policy about its importance, to action, by ensuring the provision of adequate funding for career-long teacher professional learning in and through the Arts.

Introduction

Educators are increasingly faced with what [Worsham \(2006\)](#) has described as “posttraumatic” cultural moments, namely, moments that are marked by “unprecedented historical trauma” (*ibid.* p. 170)—such as wars, conflicts, and genocides around the world. Traumatic events and posttraumatic experiences raise tremendous challenges for educators because they often create situations that are conducive to adopting reductive binary positions of we-and-they ([Zembylas, 2008, 2015a](#)). However, at the same time, traumatic events and posttraumatic experiences can also offer pedagogical opportunities for a critical exploration of the emotional complexities involved in dealing with the aftermath of these events. This exploration can be the point of departure for developing more productive ways of engaging students with posttraumatic experiences to support the long and painful process of reconciliation ([Bekerman and Zembylas, 2012; Zembylas et al., 2016](#)).

Although the chicken-and egg-problem is real and has consequences—that is, a level of sociopolitical reconciliation may need to be reached before educators touch on the sensitive issues of trauma in the classroom—curriculum and pedagogy can introduce students to some aspects of the difficult process of reconciliation ([Cole, 2007](#)). This is interpreted here to mean that educators and students engage with narratives of trauma and suffering in pedagogically sensible ways that might contribute to the broader process of reconciliation, yet without superficializing or sentimentalizing either the process of reconciliation or pedagogical efforts related to this ([Zembylas, 2013a, 2016](#)). The term “reconciliation pedagogies” has been suggested in reference to the pedagogical practices that encourage the exploration of how we might live together in societies of ever-increasing complexities and conflicts, focusing attention on aspects “such as dialog, the ‘discourse of possibility’, remembering and witnessing, and the affective dimensions of difficult, contested knowledge” ([Hattam et al., 2012](#), p. 6).

Reconciliation pedagogies, then, constitute intervention activities that are planned and organized at the everyday level of life in schools and other educational settings (formal or informal), aiming to challenge the reductive binaries that result from conflict situations and establish a *reconciliatory ethos*. A reconciliatory ethos in curriculum and teaching helps students become aware of the shared meanings, emotional complexities, and ethical interdependence that can constrain as well as expand mutual understanding and interaction with Others who may be perceived as ‘enemies’. Reconciliation pedagogies encourage students to make choices that facilitate their struggles to deal with the emotional complexities of the process of reconciliation in the aftermath of posttraumatic experiences, yet without ‘imposing’ the value of reconciliation.

The purpose of this chapter is to discuss the role of emotion in reconciliation and analyze how reconciliation pedagogies may be designed and enacted, taking into consideration the emotional complexities involved in reconciliation processes. The chapter is divided into three parts. The first part discusses the entanglement between emotion and reconciliation to show how the former is an inextricable part of the latter; as it is shown, this entanglement has important consequences for pedagogical practices. The second part of the chapter takes on reconciliation pedagogies in posttraumatic contexts and explores their potential as well as their challenges and risks. The final part outlines three pedagogical principles of reconciliation pedagogies emerging from my long-time research in this area; their discussion is meant as illustrative of the pedagogical openings that reconciliation pedagogies create to address the complex emotional issues emerging in posttraumatic contexts. At the same time, it is suggested that the limitations and risks of using reconciliation pedagogies in posttraumatic contexts need to be kept in mind.

Emotion and reconciliation

In many conflict-affected societies, one of the emerging social and political movements is that of *reconciliation* ([Auerbach, 2009](#)). Reconciliation as a term and a process is a dynamic, complex and long-term process that does not have a fixed definition across different settings ([Cole, 2007](#)). In general, reconciliation is understood as a sociopolitical and emotional process in which

antagonistic parties “acknowledge the reality of the terrible acts that were perpetrated; accept with compassion those who committed injurious conduct, as well as acknowledging each other’s sufferings; believe that their injustices are being redressed and anticipate mutual security and well-being” (Kriesberg, 1998, pp. 351–352). Proponents of this movement stress the role of reconciliation as an alternative to revenge and spirals of violence, on the one hand, while accepting that for this to happen some degree of putting aside the past may be needed, on the other (Flam, 2013).

Traumatic events, such as wars, conflicts, genocides, and terrorist attacks, generate powerful emotions—most notably, fear, grief, anger, shame, resentment, and hatred (Hutchison and Bleiker, 2008). These emotions fuel people’s perceptions and actions and make conflicts, wars, and genocides imaginable as well as the prospects of reconciliation more difficult (Des Forges, 1999). Emotions, then, are important components of historical consciousness in conflict-affected societies, and they strongly shape collective narratives, identities, and memories. In fact, some scholars (e.g., Retzinger and Scheff, 2000) argue that it is often these powerful emotions, rather than material interests, that pose the most serious obstacles to peacebuilding, healing, and reconciliation efforts. A thorough understanding of the powerful but often neglected role of emotions, write Hutchison and Bleiker (2008), is essential to increase the possibilities of establishing a culture of healing and reconciliation. Rather than assuming though beforehand that reconciliation should necessarily imply the management of certain feelings (e.g., fear, anger and resentment), it is crucial to explore *how* such feelings may become a productive part or an obstacle of the reconciliation process (Zembylas, 2013b). This argument suggests that if conflict-affected societies are to come together and engage in reconciliation, there have to be social, political and pedagogical spaces that allow individuals and groups to share their traumas, emotions and memories rather than closing down such possibilities (Bekerman and Zembylas, 2012; Zembylas, 2008, 2015a).

Hutchison and Bleiker (2008) write that there are two key issues in considering the linkages between emotion and reconciliation in conflict-affected societies. The first involves the question of what kinds of emotions may facilitate the collective reckoning with trauma and the past; the second entails how mediators (e.g., educators) might cultivate these emotions. With regard to the first issue, it is suggested that emotions such as empathy and compassion may help generate the space conducive to the acknowledgment of victimhood and the rehumanization of the Other (Halpern and Weinstein, 2004; Schaap, 2006). In particular, Halpern and Weinstein (2004) suggest that there are three important qualities in empathy that makes it particularly important for reconciliation. First, it entails seeking the individual perspective of another; this can serve as an important motivation and encouragement to place one’s self in another’s circumstances and accepts that he or she possesses the same rights. Second, empathy involves a genuine effort to get to know the Other and his or her perspectives. In contrast, polarized trauma narratives close one’s mind toward the Other’s experiences. Third, empathy involves emotional as well as cognitive openness, and the toleration of ambivalence; ambivalence entails viewing differences as an enriching part of creating an ongoing workable relationship. For these reasons, teaching and learning how to empathize with the Other’s experiences and narratives is probably one of the most challenging aspirations for education (Zembylas et al., 2016).

The second issue, namely, how mediators (e.g., educators) might cultivate emotions such as empathy and compassion, prompts broader questions concerning the task of educators to create spaces in which such emotions are worked through without establishing emotional regimes that either ‘impose’ reconciliation or undermine it (Zembylas, 2013b, 2018a,b). At stake here is not the suspension of emotions such as fear, anger and resentment in the name of the (noble) cause of reconciliation, but rather, and crucially, that the *emotional regimes* established in the process do not moralize or sentimentalize the reconciliation process in ways that end up having the opposite results. To make this argument clearer, I will recount more precisely what I mean by “emotional regimes” and what this analysis shows concerning the ways in which the institutionalization of reconciliation processes molds particular emotional regimes (e.g., in schools and classrooms).

Scholars in the history of emotion have worked on different concepts to describe and theorize how emotional regimes are established and sustained. Reddy (2001) defines ‘emotional regime’ as the set of normative emotions and the official rituals, practices, and expressions that underpin any political regime—at the micro- or macro-level. *Emotionology* is another term developed in the field of history of emotions (see Stearns and Stearns, 1985) that refers to the emotional rules constructed within a particular culture—i.e., the rules or norms by which people are supposed to shape their emotional expressions and respond to the expressions of others (Plamper, 2010). Finally, Rosenwein (2002) uses the term *emotional communities* to denote how emotional expressions and feeling rules are interwoven: “what these communities (and the individuals within them) define and assess as valuable or harmful to them; the evaluations that they make about others’ emotions; the nature of the affective bonds between people that they recognize; and the modes of emotional expression that they expect, encourage, tolerate, and deplore” (p. 842). All of the above terms—namely, emotional regime, emotionology, and emotional community—highlight the fundamental idea that *feeling rules* (Hochschild, 1979) are inevitable in any emotional expressions within a community and that these rules are expressions of power relations.

Flam (2013) suggests that the moral feeling rule produced for dealing with the past is to place the burden on the victim from whom more are demanded in terms of courage, endurance and emotions management than from the perpetrators. Flam writes about the feeling rules formulated for the perpetrators and the victims:

The obligations and feeling rules formulated for the *perpetrators* make a short list. They are to tell the truth, and to admit guilt rather than forget. [...] In an effort to convince them to reveal the truth about their deeds, it is argued that even if it is painful for them to remember or they fear the consequences of admitting their guilt, they should testify for the sake of truth, justice and reconciliation, and also because telling their story will have a healing, therapeutic effect. (2013, pp. 373–374, original emphasis)

On the other hand, the list of obligations and feeling rules for the victims is much longer, argues Flam:

They are told that they should forego bitterness and hatred, and give up revenge since revenge does not restore but only leads to escalation, excesses and mutual destruction. It destroys one's own life and upsets the society. The victims should not express rage. Instead, they should recognize the legitimate limits of feeling over the wrongdoing they experienced. (2013, p. 374)

Most importantly, the victims are caught in a double bind: on the one hand, they are told they should testify for the sake of reconciliation, even if it is painful for them and they might face consequences; even if they would rather forget, they are told they should remember, tell and heal. On the other hand, the victims are told they should leave their trauma behind and are told not to degrade or deny the dignity of the wrongdoer. The burden of reconciliation, then, is placed on the victims who, although they have the right to rage, are told that they can only achieve empowerment when they forgive the perpetrators (Flam, 2013).

Overall, according to Flam (2013), there is what she calls a *therapeutic discourse* of reconciliation imposing many more feeling rules on the victims than on the perpetrators, telling the victims how to think and reframe the situation, what to remember and tell, what to heal and forget. The victims are told that they should engage in emotions management, and get rid of their destructive emotions such as rage, hatred and resentment, for the sake of reconciliation. This therapeutic discourse calls for sensitivity and for a giving a chance to the perpetrators, while telling victims and perpetrators alike they can achieve reconciliation when they remember, tell and forgive. This joint therapeutic-reconciliation perspective establishes an emotional regime which imposes certain emotions on the victims and discourages other emotions in the name of reconciliation. The imposition of this therapeutic-reconciliation perspective on the victims has caused much frustration and disappointment among those who feel that the burden of reconciliation should not be placed on the victims (Chouliaraki, 2013; Cohen, 2001).

Arguably, then, emotional regimes are expressions of power relations because they prescribe specific feeling rules which are indicative of who holds power in a given community. This idea was originally formulated by Kemper (1978) who pointed out that power holders define cultural rules, including these pertaining to emotional expression (Flam, 2013). By recounting how emotional regimes impose certain feeling rules on the victims, one can begin to engage in a deeper theorization of events such as secondary victimization in which these feeling rules might lead to further emotional suffering for the victims. The concept of emotional regimes, therefore, can become a valuable conceptual tool in efforts to engage in critical analysis of the history and politics of emotions in conflict-affected societies.

In light of the above analysis, the next part of the chapter makes an attempt to respond to the following questions: How can educators acknowledge the emotional complexities of *difficult* events such as that of reconciliation and, specifically, how can they contribute to reconciliation through their pedagogies? Furthermore, what emotional regimes might be invoked or molded in classrooms through reconciliation pedagogies, and what are the challenges and risks involved?

Reconciliation pedagogies in posttraumatic contexts

The purpose of this part of the chapter is to show: first, the pedagogical consequences of acknowledging the emotional complexities of *difficult knowledge* (Britzman, 2000, 2013; Simon, 2011a, 2011b), that is, knowledge which is difficult to teach/learn (e.g., reconciliation) because it entails serious affective, epistemological and other challenges; and second, to argue that it is precisely this acknowledgment that enriches the radical potentiality of reconciliation pedagogies to inspire transformative emotional practices in schools and classrooms (Zembylas, 2014). Before doing so though, I want to introduce another conceptual tool that is going to be helpful in further understanding the power and tenacity of difficult knowledge in posttraumatic situations. This is the notion of difficult knowledge as a “technology of affect” (Hook, 2005); that is, how difficult knowledge implies certain mechanisms that work through the body, conduct and being to establish particular ideological and affective investments that are difficult to challenge (Zembylas, 2015c).

First of all, it is important to clarify the meaning of the term *technology*. Technology is a key term in Foucault's later work and refers to any assemblage of knowledges, practices, techniques and discourses, used by human beings on others or on themselves to achieve particular ends (Foucault, 1977; Hook, 2007; Rose, 1998). *Technology of affect*, in Hook's (2007) terminology, refers to the mechanisms through which emotions come to be instrumentalized, containing certain social norms and dynamics of inclusion/exclusion with respect to one's self and the Other. Given that emotion is never simply individual or internal (Ahmed, 2004), difficult knowledge can be understood as a form of affective technology, an affective mode of self-practice situated in a circuit of social and political meaning.

For example, consider the context of post-apartheid South Africa. The difficult knowledge of the traumatized White or Black student—who is traumatized for different reasons and in different ways (Jansen, 2009)—is manifested affectively on the basis of norms that appeal to feelings of whiteness or blackness. White and Black students carry the burden of this difficult knowledge with considerable consequences for pedagogical purposes. White students may feel resentment for being vilified for their parents' history; Black students may feel resentment when they realize that very little has changed since the apartheid era. The complexity and diversity of

these feelings have to be acknowledged by everyone involved in this process, especially in terms of the forms of exclusion and inclusion they create. As Hook writes:

It is important to acknowledge here that we may ready our affective postures in how we position ourselves in given social encounters. We may as such assume certain affect-positions (fear, anger, irritation, love) which then become the proof of affect for a given ideological proposition, for a categorical relationship of entitlement, exclusion, belonging, etc. So: that I feel threatened by an influx of immigrants is proof enough of their moral dubiousness, proof enough also of why they—and others like them—should be prevented any rights of access. (2005, p. 93)

Hook's analysis allows for the theorization of difficult knowledge as an affective technology that maintains certain social norms and structures of feeling. For example, feelings of resentment for the Other (e.g., immigrants, asylum seekers, refugees) within a country which accepts a growing number of immigrants, work as an ideological and affective position of exclusion for those who are considered *different* and inclusion for those deemed to be *similar* to the self (Zembylas, 2010). An understanding of difficult knowledge and its various complexities and nuances enables a critical consideration of how difficult knowledge is emotionally produced and maintained as forms of inclusion and exclusion. For educators to disrupt resentment, abjection and other emotions about the Other, they must understand difficult knowledge as affectively, socially and politically produced (Zembylas, 2016).

This understanding implies that a conception of reconciliation pedagogies that is merely grounded in critical pedagogy ideas—that is, negative dialectics and counter-affirmation that put an emphasis on universalizing tenets about emancipatory forces and oppressive processes, ideologies and identities—has little value in posttraumatic societies (Jansen, 2009; Zembylas, 2013c, 2018b). Needless to say, this is not to deny the systemic and institutionalized character of oppression, identity and social injustice; rather, it is to highlight that classrooms are not homogeneous environments with a common understanding of oppression, but deeply divided places where contested narratives are steeped in the politics of emotions to create complex emotional and intellectual challenges for teachers. Teachers can be themselves carriers of difficult or *troubled knowledge*, as Jansen (2009) calls it, and this has serious implications for the form that reconciliation pedagogies take in posttraumatic societies.

Consequently, a premise of reconciliation pedagogies in posttraumatic contexts should not be simply to question the dominant educational arrangements (curricula, textbooks); it should also be “the people there, the bodies in the classroom, who carry knowledge within themselves that must be engaged, interrupted, and transformed” (Jansen, 2009, p. 258). These bodies and their difficult knowledge constitute the starting point for reconciliation pedagogies in this context. Thus, taking sides early on based on justice and democracy ideals, maintains Jansen, may not be such a wise move, when there is clash of embodied knowledges and memories. For instance, a teacher who takes sides early on in a posttraumatic context in which two conflicting communities have been both *perpetrators* and *victims* may end up intensifying unsafe classroom spaces. It has long been acknowledged in critical pedagogy rhetoric that classroom is not a safe space and that some teachers and groups of students may be (unintentionally) burdened, for example, through their minority status as representatives of their group—e.g., literature that highlights the ways in which students of color in the United States are burdened with the responsibility of teaching White students about diversity (see Boler, 2004).

It is my contention here that reconciliation pedagogies in posttraumatic situations need to move a step further and be attentive and cautious of the increased complexities that difficult knowledge adds to (already) unsafe spaces in the classroom. Hence, I want to emphasize the role of reconciliation pedagogies in constructing (more) *safe* classroom spaces within which the wounded of all sides can engage in critical and productive dialog (Zembylas, 2015b). By choosing to adopt a reconciliatory ethos in a posttraumatic context, the teacher is committed to interrogate how received knowledges and re-constructed emotions underlie structures of feeling in the teaching of various narratives, without adopting a self-righteous or a therapeutic perspective.

In other words, the emotional labor that is demanded for reconciliation pedagogies in posttraumatic contexts is not intended as a self-justified approach or a therapeutic intervention that seek to validate some selected emotions or dismiss and pacify some others in the name of healing past wounds (see also Amsler, 2011). The “healing of past wounds” approach, as Mohanty (2003) and Oliver (2001) aptly point out, is problematic because it hides or dismisses the relationship between trauma and power relations. Also, other critics such as Ecclestone and Hayes (2009) emphasize that therapeutic approaches, introduced under the banners of preoccupation with students' well-being, deliberately decrease the possibility that students will experience complexity, multiplicity or discomfort in their studies; preoccupation with emotional fragility offers a deeply diminished view of the human subject and undermines the ways in which these feelings contribute unwittingly to the perpetuation of power inequalities and hierarchies.

The critical interrogation of difficult knowledge in posttraumatic contexts marks a valuable intervention in the broad domain of reconciliation pedagogies precisely by focusing on identifying and challenging the affective technologies and emotion-informed ideologies that underlie possible responses toward difficult knowledge—by students and teachers alike—and seeking to make a concrete difference in the lives of those who still suffer from carrying the burden of this knowledge. The process of dissolving categorizations of *us* and *they* in posttraumatic settings is a matter of observing very carefully the consequences of the underlying ideological and affective investments carried in the classroom. These investments need to be engaged and interrupted in sensitive, critical and strategic ways.

Reconciliation pedagogies: three pedagogical principles

In the last part of this chapter I discuss some ideas and examples that have emerged in my long-standing research in this area. In particular, I will discuss three pedagogical principles that may be used to embrace the idea of acknowledging and working with the

emotional complexities of difficult knowledge in the context of reconciliation pedagogies. These principles are: (1) the significance of pedagogic discomfort; (2) the pedagogical principle of mutual vulnerability; and, (3) the value of compassion and strategic empathy. Each of these aspects—along with their strengths and limitations—are discussed below in terms of how they help navigate difficult knowledge in sensitive and productive, yet not therapeutic or sentimental, ways.

The significance of pedagogic discomfort

In recent years, there is increasing research that acknowledges how challenging students and teachers beyond their *comfort zones* and pushing them to deconstruct the ways in which they have learned to see, feel and act constitutes a valuable pedagogic approach in social justice, citizenship and *anti-racist* education (e.g., see Boler, 1999, 2004; Boler and Zembylas, 2003; Zembylas, 2015b, 2017, 2018a; Zembylas and McGlynn, 2012; Zembylas and Papamichael, 2017). In fact, it has been argued that if a major purpose of teaching is to unsettle taken for granted views and emotions, then a *pedagogy of discomfort* is not only unavoidable but may also be necessary (Berlak, 2004). “A pedagogy of discomfort begins,” explains Boler, “by inviting educators and students to engage in critical inquiry regarding values and cherished beliefs, and to examine constructed self-images in relation to how one has learned to perceive others” (1999, pp. 176–177).

For example, individuals who belong to the hegemonic culture experience discomfort when having to confront their privileges in relation to educational and social inequities (see e.g., Leibowitz et al., 2010). Leibowitz and her colleagues, who write in the context of post-apartheid South Africa, demonstrate how a pedagogy of discomfort is valuable in uncovering and questioning the deeply embedded emotional dimensions that shape some individual and group privileges (e.g., those of White students) through daily habits and routines. By closely problematizing these emotional habits and routines and their attachments to whiteness and structural injustices, it is shown that teachers and students in a posttraumatic context can begin to identify the invisible ways in which they comply with dominant ideologies.

Additionally, Zembylas and McGlynn (2012) discuss the emotional tensions, ethical dilemmas and transformative possibilities of using pedagogy of discomfort in a post-conflict society (Belfast, N. Ireland). This work emphasizes that discomforting pedagogies require considerable vulnerability and thus the ethical responsibility of the teacher becomes a complex issue (see also, Zembylas, 2015b). Similarly, Zembylas et al. (2016) study how teachers’ discomforting emotions are manifest in a teacher education setting and how teacher educators might engage with discomfort pedagogically. These observations about the ethical, political and pedagogical challenges reiterate once again the complexities of handling difficult emotional knowledge in posttraumatic societies (Zembylas, 2017, 2018a,b).

When examined through the lens of a posttraumatic context, then, it becomes clearer how and why certain features of pedagogic discomfort concern students and teachers beyond divisions of the world into rival camps (e.g., *oppressors* and *victims*). Students and teachers come into the classroom carrying their difficult knowledge about “conquest and humiliation, struggle and survival, suffering and resilience, poverty and recovery, black and white” (Jansen, 2009, p. 361). Unsettling this knowledge demands emotional effort, careful listening to each other’s traumatic experiences, and explicit discussion of the potential and the harm that difficult knowledge stimulates.

The value of pedagogic discomfort in posttraumatic contexts cannot be overstated though. This process should not be assumed to be always already transformative, and beyond question. In other words, there are no guarantees for change in the social and political status quo; a pedagogy of discomfort, especially in light of the tensions identified here, demands time and realistic decisions about what can and what cannot be achieved. Also, concerns about the ethical implications of pedagogic discomfort must be foremost on the agenda (Zembylas, 2015b). That is, is pedagogic discomfort concerning difficult knowledge always appropriate and effective? How far can reconciliation pedagogies engage students’ discomfort without violating some ethical sensibilities? Needless to say, not all students will respond in the same way or benefit from pedagogic discomfort in the same manner; some may adopt some sort of change, others may resist, and still others may experience distress (Kumashiro, 2002).

The pedagogical principle of mutual vulnerability

The second aspect which enriches the task of reconciliation pedagogies in posttraumatic contexts concerns the pedagogical principle of *mutual vulnerability* (e.g., see Keet et al., 2009; Zembylas, 2009, 2014). The notion of mutual vulnerability is grounded in the idea that there is interdependence between human beings and that the recognition of all people as *vulnerable* has important pedagogical consequences concerning the possibility of assuming critical responsibility toward one’s own life and the lives of others in a community. The argument that is developed here is grounded theoretically in the work of Butler (2004; see also Butler, 2009, 2012, 2016).

Butler (2004) presents a number of examples to show that “each of us is constituted politically in part by virtue of the social vulnerability of our bodies ... Loss and vulnerability seem to follow from our being socially constituted bodies, attached to others, at risk of losing those attachments, exposed to others, at risk of violence by virtue of that exposure” (p. 20). This is evident, for instance, in the experience of losing someone whom one is attached to; thus each one of us is mutually obliged to others because of this common vulnerability. The denial of such vulnerability unleashes violence against others whereas its acknowledgment creates openings for an ethical encounter with others. Consequently, “we might critically evaluate and oppose,” Butler emphasizes, “the conditions under which certain human lives are more vulnerable than others, and thus certain human lives are more grievable than others” (p. 30). Once we consider how hegemonic power relations determine “who will be a grievable human” and what “acts”

are “permissible” for “public grieving” (p. 37), then we may begin to realize how a prohibition of grieving others’ lives extend the aims of violence and conflict.

The notion of vulnerability has important pedagogical consequences because the mutual experience of loss and mourning reveals the possibility of an alternative moral responsibility and sense of community (Vlieghe, 2010). Butler’s theorization of common vulnerability constitutes the point of departure for a renewed pedagogical politics of recognition in posttraumatic contexts—a politics that is not founded in a rationalist or individualistic morality, but in the experience of vulnerability as such (Zembylas, 2009, 2019). The notion of mutual vulnerability, then, enriches reconciliation pedagogies because it disrupts normative frames of community on the basis of rationality and self-advancement and puts forward the notion of community on the basis of loss. This idea does not imply, however, an equalization of vulnerability, but the recognition that there are different forms of vulnerabilities in posttraumatic contexts.

Furthermore, mutual vulnerability provides “a new grammar” for reconciliation pedagogies in posttraumatic contexts because the experiences of “the traumatized and the distressed and the micro-politics of peoples’ struggles for survival become its central pre-occupation” (Keet et al., 2009, p. 116). As Keet and his colleagues point out, writing in the context of post-apartheid South Africa, the notion of mutual vulnerability enhances the emancipatory interests of education “because the frames of its interlocutor are made vulnerable and therefore hospitable to moderation” (p. 116.). In this sense, there is more exchange of difficult knowledge between different sets of meaning-making frames; thus, in pedagogic terms, the notion of mutual vulnerability can be the starting point for acknowledging the burden of difficult knowledge carried more or less by all participants in posttraumatic settings.

The value of compassion and strategic empathy

Finally, the third principle I want to suggest here concerns the value of compassion and strategic empathy for reconciliation pedagogies in posttraumatic contexts (e.g., Zembylas, 2012, 2013b,c). In light of the discussion so far, it is evident that difficult knowledge provokes strong emotional reactions in the posttraumatic classroom—reactions that could be quite discomforting for teachers and students alike. Teachers have to find ways to handle constructively these reactions as well as the discourses that overly focus on one’s own traumatic experiences and ignore the other’s sufferings. A constructive relationship with difficult knowledge, suggest Bonnell and Simon (2007), is based on the process of confronting and dismantling any taken for granted assumptions upon encountering such unfamiliar knowledge. Importantly, then, teachers need to establish trust in the classroom, develop strong relationships and enact compassionate understanding in every possible manner. Reconciliation pedagogies in the context of posttraumatic situations require the strategic use of those pedagogical resources to enable the formation of new affective alliances among members of traumatized communities.

As noted earlier, attentiveness to mutual vulnerability is an important component of reconciliation pedagogies in posttraumatic contexts. Students are enabled to establish and maintain this attentiveness, when they begin to question and challenge arguments based on binaries like us/them, perpetrators/victims, friends/enemies, and good/evil, a stereotyping of groups considered to be *more* or *less* grievable (Butler, 2004, 2009). Jansen (2009) highlights two pedagogical tactics that I find particularly useful in teaching students how to learn compassion by challenging these binaries: first, the acknowledgment of brokenness by all sides, that is, the idea that humans are prone to failure and incompleteness and as such we constantly seek a higher order of living which cannot be accomplished without being in communion with others. Second, a pedagogical reciprocity is also required, that is, everyone carrying the burden of difficult knowledge has to move toward each other. As Jansen puts it in the context of post-apartheid South Africa: “the white person has to move across the allegorical bridge toward the black person; the black person has to move in the direction of the white person” (2009, p. 268).

To promote the prospects of compassion in the posttraumatic classroom, I also argue that one of those pedagogical resources that will be needed is strategic empathy. Strategic empathy is essentially the use of empathetic emotions in both critical and strategic ways (Lindquist, 2004); that is, it refers to the willingness of the teacher to make herself strategically skeptical (working sometimes against her own emotions) in order to empathize with the difficult knowledge students carry with them, even when this knowledge is disturbing to other students or to the teacher. The use of strategic empathy can function as a valuable pedagogical tool that opens up affective spaces which might eventually disrupt the emotional roots of difficult knowledge—an admittedly long and challenging task (Zembylas, 2012, 2013b,c). Undermining the emotional roots of difficult knowledge through strategic empathy ultimately aims at helping students integrate their troubled views into compassionate and socially just perspectives.

Compassion is further cultivated if students begin to understand the conditions (structural inequalities, poverty, globalization etc.) that give rise to difficult knowledge and suffering and acknowledge some sort of human connection (e.g., mutual vulnerability) between themselves and others. But mere understanding is clearly not enough; students will become more susceptible to affective transformation, when they enact compassionate action early on in their lives starting with simple things such as learning to be more patient and tolerant with peers who do not grasp a difficult concept in language or mathematics. As they grow up, children are offered opportunities to enact more complex manifestations of compassion that include action to alleviate the suffering of people who experience difficult times, no matter which community they come from. What needs to follow the acknowledgment of mutual vulnerability is taking action that dismisses essentialized categories of victims and oppressors and highlights instead the impact of solidarity on reducing everyday inequalities.

Conclusion

This chapter has constructed an argument about the importance of reconciliation pedagogies in posttraumatic contexts when emotional complexities and their consequences are taken into serious consideration. As it has been emphasized, this argument entails making pedagogical spaces for understanding difficult knowledge in more nuanced terms, a process enabled by “a pedagogy of strategic performance, in which teachers work to tactically position themselves as conduits of students’ affective responses” (Lindquist, 2004, p. 189). What this means for the practice of reconciliation pedagogies is that emotions are inevitably implicated in the way that difficult knowledge operates in a posttraumatic context. Without a fundamental revision of our thinking about difficult knowledge and its consequences, the radical potential of reconciliation pedagogies to reconstitute the emotional connections of traumatized students and teachers may be compromised, in spite of our best intentions (Zembylas, 2013a,b,c, 2018b). This task requires a constant reconsideration of new pedagogical resources to enhance the potential of reconciliation pedagogies such as the pedagogical principles discussed here; undoubtedly, there are many more ideas that can contribute toward this effort.

At the same time, the limitations and risks of using reconciliation pedagogies in posttraumatic contexts need to be kept in mind. There are important unanswered questions in the effort to make the emotional complexities of difficult knowledge explicit and constructive: How can teachers avoid becoming some sort of therapists for their students, when there is pressure in current times to provide therapeutic education? What are the limits of discomfort, mutual vulnerability and compassion in different posttraumatic settings so that reconciliation pedagogies retain their radical but also pragmatic potential? How far can teachers push their students to problematize their emotional responses toward difficult knowledge and to critique self and otherness in light (or in spite) of open wounds within a traumatized community? These and other important questions offer possibilities to broaden the ways that incorporate the emotional implications of difficult knowledge into our understanding of reconciliation pedagogies in posttraumatic situations.

Introduction

In their daily work, teachers are confronted with complex and unpredictable situations. To master demands that are typical for their profession, teachers are required to pay attention to relevant classroom processes and events of social interaction, select important information, draw appropriate conclusions, and decide quickly on how to proceed with their instruction. The process-related description of underlying abilities and cognitive skills are frequently referred to by the term ‘teacher noticing’. Since they are assumed to be specific for successful teaching, teacher noticing is considered being essential for the professional teacher and contributing to his or her professional competence.

Over the last two decades, research on teacher noticing has remarkably increased (König et al., 2022). Several literature reviews have been published (Amador et al., 2021; König et al., 2022; Santagata et al., 2021; Stahnke et al., 2016), summarized in encyclopedia entries (Choy and Dindyal, 2020; Jacobs et al., 2018). Moreover, teacher noticing has been discussed as a core constituent of teacher professional competence (Kaiser and König, 2019), significantly impacting the research discourse on teacher competence and teacher education effectiveness (König and Blömeke, 2020).

Various approaches to conceptualize teacher noticing exist, making it difficult to provide a single clear-cut definition of teacher noticing as a scientific term. One reason is that teacher noticing is not one-dimensional, but comprises several facets such as attention, perception, interpretation, and decision-making. Another reason is the diversity in empirical research approaches and research foci deployed by teacher noticing researchers. Over years, different perspectives have shaped research on teacher noticing (König et al., 2022; Santagata et al., 2021), leading to a heterogeneous state of research.

Moreover, teacher noticing is not limited to in-service teachers. In fact, numerous empirical studies focus on pre-service teachers learning to notice (König et al., 2022). Intervention studies show the impact specific learning opportunities have on such pre-service teacher learning (see, for mathematics, the review by Santagata et al., 2021). As will be shown in the following, teacher noticing has its place in teacher education.

The present article first provides insight into how teacher noticing has been conceptualized. It then uses two examples from teacher noticing research illustrating how empirical research has proliferated our understanding of teacher noticing, also with regards to teacher professional competence. An overview is given on how teacher education may support pre-service teacher learning to notice. We conclude with a discussion on perspectives for future research and needs for teacher education.

Conceptualizing teacher noticing

Different perspectives on teacher noticing research

In their systematic literature review on teacher noticing, which was based on about 180 publications on teacher noticing, König et al. (2022) state that a common understanding of the construct of noticing in the literature is missing. Based on existing literature

reviews and survey papers, König et al. (2022) therefore suggest to differentiate between relevant perspectives on teacher noticing research such as a “cognitive psychological perspective” referring to the work by van Es and Sherin (2002), a “socio-cultural perspective” originating from the work by Goodwin (1994) on professional vision and an “expertise-related perspective” resulting from the research paradigm of differences between novice and expert teachers as discussed by Berliner (1988). (For a fourth perspective, too detailed to present here as well, see König et al., 2022).

Cognitive-psychological perspective

According to König et al. (2022), a cognitive-psychological perspective can be identified that focuses on noticing in terms of what teachers attend to and make sense of. This perspective is closely related to the well-known work by van Es and Sherin (2002: 573) who proposed the following conceptualization of teacher noticing: “(a) identifying what is important or noteworthy about a classroom situation; (b) making connections between the specifics of classroom interactions and the broader principles of teaching and learning they represent; and (c) using what one knows about the context to reason about classroom interactions”.

Over the last two decades, this conceptualization has been used as a theoretical reference for numerous empirical studies. As a frequently cited article, van Es and Sherin (2002) might be considered as a cornerstone in teacher noticing research. Meanwhile, further differentiations of this conceptualization have been suggested as well indicating that “no consensus has yet been reached on the different facets of noticing” (König et al., 2022).

Socio-cultural perspective

Emphasis on the social and situated nature of teacher noticing has been given with the well-known conceptualization of “professional vision” as it was introduced by Goodwin (1994). He proposed that “the ability to see a meaningful event” is “a socially situated activity” which evolves through discursive practices of professionals (Goodwin, 1994: 606). These “discursive practices are used by members of a profession to shape events in the domains subject to their professional scrutiny. The shaping process creates the objects of knowledge that become the insignia of a profession’s craft: the theories, artifacts, and bodies of expertise that distinguish it from other professions.” (Goodwin, 1994: 606). As Goodwin further explains, on the basis of these discursive practices, “participants build and contest *professional vision*, which consists of socially organized ways of seeing and understanding events that are answerable to the distinctive interests of a particular group” (Goodwin, 1994: 606). Thus the conceptualization of “professional vision” relates to the group-specific perspectivation and privileges, for example in terms of expertise, thus serving the demarcation from persons not belonging to the relevant profession (e.g., clients or laypersons) (Lefstein and Snell, 2011).

It is important to note that the conceptualization of “professional vision” by Goodwin (1994) and its development was not specified for the teaching profession. As König et al. (2022) outline, later on “professional vision” was incorporated into the discussion of teacher noticing as it emerged through the previously described cognitive-psychological perspective. As a consequence, numerous authors relate their work on teacher noticing to the conceptualization of professional vision (e.g., Sherin and van Es, 2009; Jacobs et al., 2010).

Expertise-related perspective

In applying and specifying the expertise research paradigm to teachers, Berliner and colleagues (Berliner, 1988, 2001, 2004; Carter et al., 1988; Sabers et al., 1991) created important approaches to teacher noticing as well. Although teacher expertise research as a paradigm may not directly focus on teacher noticing (Bromme, 2001; Stigler and Miller, 2018), teacher expertise and its development from novice to expert forms an important reference supporting the conceptualizations from cognitive-psychological and socio-cultural perspective. Therefore, Lachner et al. (2016: 198) consider expertise research “as precursors” to research on teacher noticing.

Prevalence of perspectives

In their systematic literature review of about 180 publications on teacher noticing, König et al. (2022) analyzed how the different perspectives have shaped empirical research studies on teacher noticing over the last two decades. It turned out that the cognitive-psychological perspective has strongly come to the foreground, whereas combinations with the other perspectives can be observed and interpreted as enrichment of conceptualizing teacher noticing. In contrast, the socio-cultural perspective related to professional vision has been applied by empirical studies to a far less extent. As König et al. (2022) state, only few researchers actually followed the original approach initiated by Goodwin (1994) such as McDonald (2016), Lefstein and Snell (2011) or Louie (2018). At the same time, the notion of professional vision has been taken up in quantitative studies, mainly originating from Germany, with a close link to concepts of instructional quality (e.g., Seidel and Stürmer, 2014), leading, however, into a direction that clearly differs from the Goodwin’s (1994) original approach (see, for more details, König et al., 2022).

Facets of teacher noticing

To understand conceptualizations of teacher noticing more closely, it is important to look at differentiations into facets as suggested by teacher noticing researchers. As König et al. (2022) conclude from their systematic review of about 180 publications on teacher noticing, empirical approaches principally differ with respect to whether researchers have investigated noticing as a “holistic concept” or developed a differentiation into facets, typically “attending/perceiving”, “interpreting/reasoning”, and

“decision-making”. For example, [Kaiser et al. \(2015\)](#) identified perception, interpretation, and decision making as facets of noticing. The cognitive processes behind these faces are also well-known from teacher reflection approaches, which underlines the relevance of differentiating teacher noticing in facets. For example, in her “reflective cycle”, [Rodgers \(2002\)](#) suggested to distinguish among three phases of teacher’s action: (1) describing significant events of teaching, (2) assigning meaning to these events, (3) making decisions for how to proceed. While a large number of empirical studies deploy qualitative methodology and investigate teacher noticing holistically, [König et al. \(2022\)](#) identified an increase of quantitative studies that are committed to develop standardized measures with the explicit objective to differentiate various facets of teacher noticing.

Noticing as part of teacher professional competence

In recent studies on teacher professional competence, teacher noticing has become part of modeling and measuring competence. In particular, [Blömeke et al. \(2015a\)](#) presented a framework of teacher competence that accounts for the interaction of personal, situational, and social characteristics. Starting from the argument that former conceptualizations of competence neglect either the stable dispositional or the more variable situational competence facets and suggesting approaches should complement each other, [Blömeke et al. \(2015a\)](#) describe competence along a continuum from personal dispositions, comprising teacher professional knowledge and beliefs, to situation-specific cognitive skills, comprising perception, interpretation, and decision-making, that finally predict the observed teacher performance in the classroom (as a similar competence as continuum model see the “cascade model” by [Krauss et al., 2020](#)). As these situation-specific skills not only cover the perception and interpretation of situations as well as subsequent decision-making, but are also based on teachers’ professional knowledge, the framework developed by [Blömeke et al. \(2015a\)](#) overlaps conceptually with teacher noticing ability to pay selective attention to critical locations in a complex classroom environment as well as “the ways in which a teacher reasons about what is noticed based on his or her knowledge and understanding” ([Sherin and van Es, 2009](#): 22). Thus, current advances in modeling teacher professional competence not only integrate conceptualizations of teacher noticing, but they also link teacher noticing to teacher professional knowledge as described and classified in teacher knowledge research ([Shulman, 1987](#)) as well as referenced by teacher expertise research ([Bromme, 2001](#); [Stigler and Miller, 2018](#)). Moreover, the function of teacher noticing for successful teacher performance comes to the foreground as well. That means, teacher noticing is not only a construct to be investigated as such, but teacher noticing researchers are also encouraged to provide evidence for its predictive validity in classroom teaching and student learning ([König et al., 2021](#)).

Modeling and measuring teacher noticing

When collecting empirical research data on teacher noticing, many researchers typically deploy video material of teaching as a means of stimulating noticing among pre-service or in-service teachers ([Gaudin and Chaliès, 2015](#)). As quantitative approaches to model and measure teacher noticing have increased recently ([König et al., 2022](#)), two examples are provided in the following. The first approach was developed in the context of the Teacher Education and Development Study in Mathematics (TEDS-M) research program ([Kaiser and König, 2019](#)), with specific focus on mathematics education. The second approach relates to effective classroom management as one of the core demands teachers have to master during their daily work ([König, 2015](#)).

Teacher noticing in mathematics

Between 2011 and 2014, a follow-up of the comparative large scale assessment TEDS-M 2008 was conducted in Germany. Besides broad assessments of teacher knowledge, a novel approach was developed to assess noticing of early career teachers. Following the strategy of TEDS-M to recruit samples that would represent a country’s teacher candidate population for teaching mathematics, the follow-up survey, conducted about four years after TEDS-M, addressed former participants of the study TEDS-M from all over Germany who had entered the teaching profession by 2012.

Teacher noticing was conceptualized for mathematics and pedagogy. Three staged video-clips with a length of about 3–4 min were created as stimuli, followed by closed and open response tests items to measure situation-specific skills of perception, interpretation, and decision-making. Some of these test items were related to mathematics pedagogical content knowledge (MPCK), others to general pedagogical knowledge (GPK) of teachers. The video-clips were construed in a way that they relate to lengthy intervals of teaching a lesson, although providing thin slices of classroom events and procedures.

Test items had two different formats. Some of them were multiple-choice items with a Likert-rating scale (four categories) ranging from “completely agree” to “completely disagree”. They were used to measure the precision of teacher perception (e.g., “The teacher presents the lesson’s task visually AND acoustically”) or the holistic nature of teacher perception (e.g., “Most students take an active part in the lesson”). An expert review was conducted to assure the correct solution of each item’s rating scale (see for details, [Hoth et al., 2016](#)).

Open-response items were applied to measure the situation-specific skills of interpretation and decision-making. These items were designed to enable teachers in providing cognitively more complex statements. For example, one of the video-clips focuses on students computing the volume of a box during pair-work. The video-clip shows three different pairs and visualizes different kinds of cooperation. One of the open-response items then asks the testtakers for an in-depth analysis of cooperation from a pedagogical perspective. Based on test items and scaling analyses, reliable total scores of teacher noticing were created,

one for mathematics pedagogy, another one for general pedagogy (Blömeke et al., 2015b; König et al., 2014). More specific scaling analyses on teacher noticing can be found in König et al. (2014). First, structural analysis showed perception and interpretation are two situation-specific processes that can empirically be separated thus confirming important theoretical underpinnings of the noticing construct. Second, declarative teacher knowledge seems to be more closely related to processes of interpretation than to processes of perception. Further findings from this kind of research on the nature of teacher noticing as a construct has been currently proliferated in a more recent analysis of the TEDS-M research program by Bastian et al. (2022), who investigated how teachers' noticing can be empirically differentiated and subscales of perception, interpretation, and decision-making be used for a description of growth toward expertise in secondary mathematics teaching.

Teacher noticing for effective classroom management

In a different project (König, 2015), an approach was developed to specifically measure and model teacher noticing for effective classroom management. Using the expertise-related perspective (see Section **Expertise-related perspective**), the focus was on measuring expert-novice differences in the perception and interpretation of teacher-student interaction situations typical for effective classroom management. As the test instrument primarily targeted on in-service teachers with sufficient teaching experience (as a precondition to expertise, but not being the same, see Caspari-Sadeghi and König, 2018), the test instrument was denoted as Classroom Management Expertise (CME).

Similar to the video-based instruments in the TEDS-M follow-up study (see previous section), four video-clips served as stimulus, followed by test items relating to each video-clip specifically. From a content-related perspective, the situations depicted in the video-clips refer to typical classroom management situations. Following classifications of typical classroom management situations found in the literature (Hawk and Schmidt, 1989; Doyle, 2006), the video clips had to represent classroom instruction in which a teacher is challenged (1) to manage transitions, (2) to manage instructional time, (3) to manage student behavior, and (4) to manage instructional feedback to students. Test development comprised several steps: First, an expert review before the procedure of selecting appropriate video clips was started. Second, test items were developed to cover situation-specific skills of perception and interpretation. Third, coding rubrics were developed for the open-response items. Fourth, in a pilot study rubrics were examined and finalized for a coding manual that could be used in training raters. Based on a sample of about 120 in-service teachers, findings showed that teacher noticing for effective classroom management can be measured in a reliable way using the CME test (König, 2015).

Further studies using the CME test show that teacher noticing for effective classroom management is specifically related to declarative pedagogical knowledge in the area of effective classroom management rather than pedagogical knowledge of structuring lessons, dealing with heterogeneous learning groups, or assessing students (König and Kramer, 2016). The higher a teacher scores in the CME test, the better his or her instructional quality is rated by external observers, which in turn contributes to learning progress of students, as the finding from multilevel-analyses by König et al. (2021) can show.

The development of teacher noticing during teacher education

Intervention studies

Reviews have highlighted the overall support of using videos in teacher education, also to stimulate pre-service teachers' learning to notice (Gaudin and Chaliès, 2015; Santagata et al., 2021). More specifically, Santagata et al. (2021) analyzed a selection of 35 empirical studies that deployed video as a supporting tool in mathematics teacher education. It turned out that there were several benefits in using video as a tool, for example for "anchoring discussions of teaching and learning around specific evidence" (Santagata et al., 2021: 128), and the underlying frameworks for watching videos provided a helpful orientation for learning to notice.

Using about 70 articles for their literature review of intervention studies in teacher noticing during teacher education, König et al. (2022) analyzed what the authors of each study themselves reported and interpreted about the improvement in noticing skills. Findings showed that about at least half of the studies comprised descriptions on the improvement of (pre-service) teachers' skills in the teacher noticing area of attending and/or reasoning. Only few studies reported on more complex skills such as proposing alternatives which was found in less than 10% of the studies. So further empirical investigation into how teachers make decisions based on their noticing seems to be a research desideratum. Another problematic issue is that authors used different interventions designs and noticing measures, making it difficult to reliably compare findings across different studies.

Expert-novice comparisons

Following the expertise-related perspective, some studies on teacher noticing have investigated possible learning progress in contrasting pre-service and the more experienced in-service teachers. König et al. (2022) systematically identified a group of studies (Gold and Holodynski, 2017; Jacobs et al., 2010; Meschede et al., 2017; Star and Strickland, 2008; Wolff et al., 2016; Dreher and Kuntze, 2015; Reuter, 2017a, b) that all approached expert-novice contrasts by using standardized measures for teacher noticing. These studies share the common finding that experts outperformed novices, although different constructs and facets of

noticing were deployed by the studies. This allows to conclude that differences between novices and experts seem to be quite stable across different subjects and research designs (see, for more details, König et al., 2022).

Another example for differences between novice teachers and experienced teachers is provided by König and Kramer (2016) using the CME measure (see Section **Teacher noticing for effective classroom management**) for investigating teacher noticing for effective classroom management. Experienced teachers also outperformed pre-service teachers, showing that teacher noticing for effective classroom management “is much more dependent on the expertise level acquired during professional development” (König and Kramer, 2016: 149).

Conclusion

Teacher noticing is an important construct to describe teacher professionalization and teacher professional competence. Research on teacher noticing has remarkably increased over the last two decades, proliferating empirical evidence on its relevance for teaching and teacher education. In particular, quantitative studies with standardized measurement of teacher noticing that target on pre-service teachers learning to notice provide substantial evidence through interventions or expert-novice difference analyses.

Although this increase and proliferation of findings on teacher noticing and its development during initial teacher education is promising, the state of research clearly has its limitations. For example, while van Es and Sherin (2002: 573) highlighted “identifying” and “making connections” as key aspects of noticing, the systematic review conducted by König et al. (2022) showed that only about 10% of all studies provided an analysis of how noticing is connected with professional teacher knowledge. This indicates a research desideratum indicated as early as by Schoenfeld (2011). During the last two decades, standardized assessments of teacher knowledge have increased (Kaiser and König, 2019), therefore it might be just the next step to figure out the relationship between knowledge and noticing in near future research (Yang et al., 2020).

In a similar way, only few studies examined how teacher noticing is actually related to teaching practice. Competence models such as conceptualized by Blömeke et al. (2015a) emphasize the significance of noticing skills like perception, interpretation, and decision-making for observed teacher behavior which in turn should contribute to the quality of learning opportunities delivered to students as well as the learning progress of students. However, only few studies have actually provided in-depth analysis of the underlying chain that comprises measures of noticing, measures of teaching practice, and student learning outcomes. For example, Kersting et al. (2016) provided empirical evidence for mathematics teacher noticing can predict instructional practice. Similar, in a recent analysis, König et al. (2021) demonstrated that teacher noticing for effective classroom management (as measured via the CME instrument, see Section **Teacher noticing for effective classroom management**) was predictive for instructional quality which in turn contributed to student learning in mathematics. However, correlations were only of small to moderate effect size, and not all hypotheses developed by authors could be confirmed, making it necessary to intensify this specific research field. Moreover, competence models themselves should further be examined, for example by more studies using the expert-novice comparison principle. Finally, although the number of studies trying to distinguish various facets of teacher noticing have increased and may contribute to our understanding of the cognitive processes underlying noticing, our theoretical and empirical knowledge seems to be limited. Researchers should be encouraged to develop and apply innovative empirical approaches in the near future, such as using new digital technologies to provide authentic stimuli (e.g., using virtual reality glasses or eye tracking, see Smith, 2012; Wolff et al., 2016). But the further elaboration of theoretical frameworks on teacher noticing seems also a necessity to show future directions of teacher noticing research.

Introduction

Teachers play a key role in fostering positive student outcomes, but does it matter *who* is recruited into the teaching workforce? And if the answer is *yes, it does matter*, are there desirable personal characteristics that can be identified and evaluated in the recruitment process? Evaluating prospective teachers' *competencies*—the academic and non-academic knowledge, skills, abilities, and values—presents an ongoing challenge and is not without controversy. First, there is a multitude of personal characteristics and contextual factors to consider, and deciding which competencies are (a) most important, and (b) reliably evaluated is difficult. Second, recruitment decisions involving people who are at the beginning of their careers will always prove challenging with a large degree of “fuzziness.” Third, there are multiple definitions of “success” or “effectiveness” for teachers, and making predictions during recruitment about success in initial teacher education (ITE) may involve different factors than making predictions about success at Year 1 or Year 5 of professional practice. Teacher recruitment is a complex and multivariate problem, but building on a foundation of theory- and research-supported competencies increases the likelihood of building a strong and effective teacher workforce. This article describes a “competency-based approach” for two facets of teacher recruitment: *attracting* applicants to consider entering the profession and *selecting* the best possible candidates from a pool of applicants.

Two sides of teacher recruitment

There are two sides to teacher recruitment—attraction and selection—and the relative weighting between these two recruitment activities varies according to national and regional contexts. In some settings (e.g., Singapore and Finland), there is not a very strong need to attract more applicants, and so the recruitment emphasis falls heavily on the side of selection. In these “selection-focused” settings, entrance into ITE involves a rigorous selection process designed to identify the most promising candidates from a deep pool of qualified candidates, and less explicit attention is paid to attracting applicants to consider the profession. In “attraction-focused” settings (e.g., some Asian and European countries, some parts of the United States, Australia, the United Kingdom), the applicant pool for ITE and jobs may not be very deep, and the recruitment emphasis is weighted toward attracting more high-quality applicants. In these settings, many of the policy and practice discussions focus on ways to attract high-quality candidates into considering the profession, with recruitment strategies centering on short-term solutions involving financial incentives that may not recruit candidates who are well-suited to the profession. Whether the recruitment focus falls on attraction or selection, a competency-based teacher recruitment program is built on the belief that candidates come with a wide range of background experiences and personal competencies, and that these individual differences play a role in predicting future teaching behaviors. Although some of these individual differences are fleeting (e.g., mood, interest), others are more enduring (personality and aptitude), and are at the heart of recruitment activities.

Four opportunities to build the teaching workforce

There are four key opportunities to build a strong teacher workforce (see Fig. 1): during recruitment (attraction), selection, ITE, and professional practice. Most efforts to improve the teacher workforce have focused on improving ITE (Greenberg et al., 2015) and in-service professional development (e.g., Gore, 2021), with less systematic attention paid to improving the way that we attract and select individuals into the profession. Delivering high-quality development programs during ITE and professional practice is important to build a strong workforce, but can be expensive and sometimes ineffective, with teachers' professional development especially suffering from poor returns on investment (Greenberg et al., 2015). Strengthening the teacher workforce during ITE and in professional practice is critical and can bring lasting improvements. However, building better attraction and selection methods represents a "quick win" in building the teacher workforce, with system-wide benefits attained at a relatively modest cost. Each of these workforce-building opportunities can be built on a foundation of key competencies, but attraction and selection systems especially benefit from being built with an explicit link to the academic and non-academic competencies that form the bedrock of successful teaching (see Fig. 1).

Teacher attraction

Decisions about entering the teaching profession are influenced by candidates' perceptions of the *utility values* associated with embarking on a teaching career; namely *personal utility values* and *social utility values* (see Fig. 2). Personal utility refers to beliefs about the personal benefits of the profession (e.g., stability, progression opportunities, working conditions), or in some settings, consideration of financial incentives such as grants or bursaries to enter training. Teacher attraction strategies are frequently based on highlighting the personal utility associated with the profession. See et al. (2020) reviewed teacher attraction methods across 20 studies and found that most teacher attraction strategies depended on offering financial incentives, but warned that bursary schemes and other financial incentives tended not to have lasting effects. They found no strong evidence that other personal utility approaches, for example, offering better mentoring, induction, or development programs, made a lasting impact on attracting and retaining new teachers.

Another influence on career decision-making is perceptions of the social utility of teaching; that is, perceptions of how teaching makes a social contribution through improving the lives of children and young people. Teacher attraction advertising campaigns are frequently built on heightening perceptions of the social utility associated with the profession. Klassen et al. (2021a,b) examined

Fig. 1 Four opportunities to strengthen the teacher workforce.

Fig. 2 Career decision-making model.

recruitment messages in public-facing media campaigns for two major education players in the UK (the Department for Education [DfE] and Teach First) and contrasted these campaigns with those from the National Health Service (NHS). They found that DfE advertising campaigns (e.g., *Every lesson shapes a life*) emphasized the social utility of a teaching career, whereas the Teach First advertisements emphasized both personal utility (e.g., *in terms of career progression ... it's been a superb choice*), and social utility (e.g., *Let's give opportunities to kids who wouldn't normally have these opportunities*). In contrast, the NHS recruitment campaigns were built on a “values-based approach” in which candidates were urged to consider the fit between their own values and those of the organization. Basing teacher recruitment campaigns on personal and social utility can help attract people into considering the profession, and may encourage some candidates into moving toward the selection phase of recruitment.

Teacher selection

Current teacher selection methods have been described as “ad hoc” (Goldhaber et al., 2014), with weak empirical and theoretical foundations underpinning their use (Klassen and Kim, 2019). This lack of research on analyzing the effectiveness of selection methods is surprising considering the importance of the interest in building high-quality education systems worldwide, and in light of the considerable research on selection in other fields. When selecting candidates for ITE or jobs, most education systems evaluate one or more academic competencies (e.g., subject knowledge and/or basic skills), non-academic competencies (such as motivation and resilience), and background factors such as qualifications and teaching-related experiences. Assessing academic competencies and background factors is relatively straightforward: records of academic competencies such as academic transcripts are readily available, and if further data is desired, standardized subject knowledge and literacy/numeracy tests are readily available.

Programs face a greater challenge when evaluating the non-academic competencies that they deem to be important for success as novice teachers. Conducting reliable and valid assessments of empathy, interpersonal relationships, and motivation is more difficult to carry out during screening or selection than assessing academic skills. Teacher selection methods may pay lip service to teaching standards as behavioral definitions reflective of multiple competencies and values (e.g., Casey and Childs, 2017), but the methods chosen for selection may not reliably assess these competencies. In any field, selection methods require regular evaluation of their reliability (consistency over time), validity (evidence of predictive utility), and fairness for all applicants, regardless of age, gender, ethnicity, sexuality, and socioeconomic status. An evidence-supported competency-based approach to teacher recruitment first identifies a framework of desired competencies based on theory and research, and then develops reliable, valid, and unbiased methods to assess these competencies.

Person-vocation fit and competency-based recruitment

A competency-based approach to teacher recruitment is built on person-environment fit (PE fit) theory which holds that the fit between people and their environments is a key determinant of human flourishing (Darrow and Behrend, 2017). Sub-categories of PE fit include person-vocation fit (PV fit), defined as the fit between an individual's personal characteristics (e.g., interests, abilities) and the demands of a career path, and person-organization fit (PO fit), defined as the fit between an individual and a particular organization (e.g., school or education system). Research suggests a strong relationship between PV fit and applicants' beliefs about a job before considering an occupation, and between PV fit and on-the-job behaviors related to job performance and at-work attitudes (Vogel and Feldman, 2009). A meta-analysis conducted in 2012 showed that perceived fit was a strong predictor of job attraction through multiple stages of the recruitment process (Uggerslev et al., 2012). Another meta-analysis (Chapman et al., 2005) showed that although job-related and organizational characteristics were important factors in applicants' career decisions, perceptions of fit were the strongest predictors of career decisions. The fit between individual and vocation serves as the foundation for competency-based recruitment strategies in a range of professional disciplines.

Examples of competency-based recruitment outside of education

Recruitment research and practices have seen a shift toward competency-based (and values-based) approaches in health and business fields in the last decade. The National Health Service (NHS) in the UK is a prime example of a health organization that has shaped its recruitment, selection, training, and professional development activities around a core of key competencies, or “values” that underpin its service. A *values-based* approach to recruitment involves recruiting and selecting individuals for roles based on the fit between organizational values—variously described as “enduring beliefs” or “motivational goals”—and an individual's professional values (what we term competencies in this article), such as integrity, compassion, and commitment. The NHS builds its recruitment activities, including attraction, screening, and selection, on six core values (*Respect and dignity, Commitment to quality of care, Compassion, Improving lives, Working together for patients, Everyone counts*). Following the recruitment process, the six values underpin post-selection activities such as education, training, and establishing organizational culture (NHS, 2021). Other organizations, including the College of Policing in the UK (2018), have developed a combined competency and values-based framework that underpins their organization, with six competencies (e.g., innovative, emotionally aware, collaborative) encompassing four values (e.g., transparency and integrity). These values and competencies are further defined by their operationalization as behaviors, that is, the behavioral manifestations in policing practice. Similar competency-based (or values-based) approaches are embraced in specific health-related fields (e.g., midwifery; Power and Clews, 2015), and also in large corporations (e.g., KPMG, 2021). The identified competencies across occupational groups are often widely similar (e.g., integrity, empathy), and can be used as a point of

reflection when building competency-based attraction and selection programs in education. Competency-based approaches from other disciplines can serve as models for teacher recruitment strategies.

A competency-based approach for teacher recruitment

Although most research on competency-based recruitment has been conducted in settings outside of education, a handful of studies with teachers or prospective teachers have examined how perceived fit with desired competencies influences recruitment outcomes. De Cooman et al. (2009) found that teachers who perceived a fit between their personal values and the perceived values of their schools were more likely to stay in their jobs. Player et al. (2017) found that the person-vocation fit was predictive of retention: teachers with perceived fit one standard deviation above average were 43% less likely to leave the profession. From a theoretical perspective, these perceptions of fit mediate the relationship between attraction to the profession and the decision-making process. Fig. 3 shows graphically how perceived personal and social utility influence attraction, and how the relationship between attraction to the profession and career decision-making is mediated by perceptions of fit.

When a candidate considers the fit between their own competencies and those salient to teaching, they seek out information from multiple sources: their past experience in schools, advice from their social network, and from recruitment messages delivered by education organizations (e.g., ITE programs and national education bodies). Some ITE programs explicitly target a set of non-academic competencies that they want to see reflected in their preservice and practicing teachers. For example, one program in the UK lists several competencies that applicants should demonstrate, or show the potential to demonstrate: *humility, respect and empathy; interaction; understanding and motivation; leadership; planning and organizing; problem-solving; resilience; and self-evaluation*. In this program, the targeted competencies are evaluated explicitly in selection activities that include, three “motivation statements,” individual interviews, a group activity, and a self-evaluation exercise, each of which targets a particular non-academic competency. Another ITE program in the UK is focused on developing new teachers who are *creative, proactive, and reflective*, with selection activities that are focused on evaluating these competencies. In Australia, several ITE programs have adopted a set of 10 academic and non-academic competencies, including academic competencies such as *ethical behavior, behavioral stability, reflective skills, and relational skills*. Identifying a set of key competencies is the first step in developing a competency-based selection process, with selection activities focused on evaluating these competencies.

It is one thing for education organizations to list a set of desired competencies in their recruitment process, but explicit consideration of these competencies and the methods used to evaluate these competencies is relatively rare. More typical is the example of a large and high-ranking ITE program on the west coast of the United States, where non-academic competencies are assessed through a “goal statement” that is designed to assess “*a passion for teaching ... and an interest in issues of social justice*” with little attention paid to the reliability and validity of the methods. This is ineffective since personal statements are notoriously unreliable predictors of future performance (Patterson et al., 2016). The explicitness of the target competencies is not always made apparent to applicants, and the methods and scoring approach used to evaluate the competencies are not always very specific. Recruiting and selecting new teachers is a “predictive exercise” where education organizations are attempting to attract and identify candidates who will experience success as teachers. Building a framework of the non-academic competencies that are key for this success can underpin the recruitment, selection, and development phases of a teaching career.

Testing a person-environment fit model with Canadian teachers

An education-relevant person-environment fit model was recently tested in a sample of 1086 practicing Canadian teachers (Wang and Klassen, 2021). The researchers analyzed data from a two-wave longitudinal study that tested how teachers’ utility values were related to their quitting intentions. Personal utility values were operationalized as *prestige, autonomy, and job security*, while social utility values were operationalized as *altruism, student relationships, and co-worker relationships*. Results from structural equation modeling (see Fig. 4) showed that teachers who valued autonomy, prestige, and job security (personal utility values) were more likely to express intentions to leave the profession. Teachers who put more value on their relationships with students and peers, and who valued the altruistic values of the job (social utility) were more likely to express the intention to stay in their current position and in the profession overall. Teachers’ perceptions of their fit with their organization (i.e., school) mediated the relations between social utility values and attrition intentions, but did not have the same mediating effect for the relations between personal utility and quitting intentions; i.e., teachers’ valuing of prestige, autonomy, and job security had a direct effect on their intentions to

Fig. 3 A mediated model of career decision-making.

Fig. 4 Utility values, value congruence, and quitting intentions.

leave the profession. Of the three personal utility values, a perceived lack of autonomy support had the strongest effects on intention to leave the profession, suggesting that organizations may wish to consider how impositions on teachers' professional autonomy have serious consequences for teacher retention.

Attracting prospective teachers using a competency-based approach

Although teacher attraction strategies based on personal and social utility may be effective at least in the short term, they can also attract applicants who have an unrealistic view of the profession, resulting in high attrition rates due to eventual feelings of mis-fit (Baur et al., 2014). For example, a decision to enter the profession based on bursaries for shortage subjects (i.e., based on personal utility) may result in high attrition rates once bursary payments are no longer in effect (See et al., 2020). A decision to enter the profession based on altruistic reasons (*I'll really be making a difference in children's lives!*) may spur some candidates to apply for training, but without consideration of personal fit with the competencies needed for success, these social utility values may lose their motivational appeal when the "reality shock" of teaching is felt in the challenges typically experienced in the 1st year. Teacher recruitment (attraction) strategies that capitalize on personal and social utility models may be effective in the short term to inspire candidates to enter the profession, but building a recruitment strategy that also includes consideration of person-vocation fit and the competencies needed for teaching promises a more robust, theoretically-sound, and sustainable recruitment program.

A recent intervention study (Klassen et al., 2021a,b) was conducted by attracting university students in STEM (Science, Technology, Engineering, and Mathematics) programs and inviting them to consider teaching as a profession with *realistic job previews*, or RJPs built on a person-vocation fit foundation. RJPs are a recruitment method where potential applicants engage with realistic workplace scenarios, with the over-arching question, *How well do you fit with this job?* A fit message provides participants with an indication of how well their responses fit with expected responses from those already in the field. Research using an RJP approach has been conducted for more than five decades, with results showing increases in better integration once in the job, along with lower attrition rates and better workplace outcomes (Baur et al., 2014). RJPs can be delivered through a variety of methods, including video and text, and have been used for recruitment purposes in a range of fields, but not previously in education.

Klassen and colleagues recruited UK undergraduates in STEM-related fields to participate in the study. The brief RJP intervention was delivered online (to participants' phone, tablets, or computers) using four animated classroom scenarios. Participants (a) viewed the animated video, (b) rated the appropriateness of three possible responses, (c) wrote a reflective rationale for their response, (d) received real-time feedback on the alignment between their ratings and those of experienced teachers, and (e) were provided with a rationale from experienced teachers for the appropriate responses to the scenario. The study results showed that the intervention had a significant positive effect on participants' interest in pursuing a teaching career ($r = 0.26$); the results were robust after controlling for prior career intentions. Analysis of subsequent individual interview data examined how the intervention was perceived by participants: *The activity showed that I had a similar ideology as a teacher so made me think that maybe I would be suitable; it really helped me think about how teachers think.* The study showed how a brief, cost-effective and scalable intervention based on person-vocation fit could supplement current teacher attraction strategies based on personal and social utility values.

Selecting prospective teachers using a competency-based approach

Teacher selection involves making predictions about how candidates will fare in the short-term (i.e., in training), and longer-term (i.e., in professional practice). A robust and defensible process for selection is needed when the number of applicants is greater than the number of places (for training or for jobs), when there is a need to screen out unsuitable applicants, and when there is a need to identify applicant strengths and weaknesses for future development. Although competency-based selection methods in other fields have been the subject of in-depth research attention in recent years, these methods have infrequently been applied to teacher selection. Most current teacher selection methods—academic records, personal statements, group interviews, reference letters, lightly-structured interviews—have been shown to lack predictive power and to be subject to biases against certain groups of candidates (Patterson et al., 2016). Two competency-based methods—situational judgment tests (SJTs) and multiple mini-interviews (MMIs)—have been successfully implemented in fields outside of education for the last two decades and have recently been developed and tested in education settings.

Situational judgment tests

Situational judgment tests (SJTs) have become increasingly popular in the last two decades because, in comparison to other selection tools, they show high levels of predictive validity and can be built on a set of desired competencies. SJTs consist of a stem scenario that depicts a challenging workplace situation, and a series of response options outlining possible courses of action, and can be delivered in text-only or video + text formats. Early versions of SJTs were used to evaluate the situational judgment of officer candidates in World War II, and subsequently have been used for selection into medical training, the civil service, and large corporations. The theories underpinning SJTs include *implicit trait policy* (Whetzel and McDaniel, 2009), which refers to an individual's implicit beliefs about the advisability of expressing specific personality traits and motivations in particular situations. SJTs are typically designed to capture information about how particular competencies (e.g., empathy, adaptability, commitment) are expressed in particular contexts. Other tools used for selection may be “context-free” (e.g., tests of personality or emotional intelligence) but it is the interaction between context (e.g., a classroom situation in a teacher selection SJT) and the targeted competency that separates SJTs from other recruitment tools.

Recent research and meta-analyses show that SJTs administered as selection tools at the beginning of training programs can be robust predictors of job performance (e.g., Patterson et al., 2013) and are less prone to group biases that plague other selection methods. The development of SJTs for selecting prospective teachers promises the advantages of clear links to key competencies, efficiency (i.e., modest time investment for implementation after development, and especially helpful for screening large numbers of applicants), and effectiveness, with SJTs shown to be one of the most predictive tools available for selection (Patterson et al., 2016). However, SJTs are relatively new in teacher education circles, possibly due to a historical reluctance to move away from more “intuitive” (but largely ineffective) selection approaches (e.g., Davies et al., 2016).

Situational judgment tests for teacher selection

SJTs have not often been implemented for selection into teacher education or for entry into the profession, but the last few years have seen an increase in their use (see Fig. 5 for a still shot from a video SJT from the Teacher Selection Project). Klassen and Kim

You are teaching a 9th-grade science lesson when you notice one of your students, Jake, using his mobile phone. Your school has a ‘no phone in class’ policy, and you have already warned Jake about using it in your classroom. Jake seems to have forgotten your warning, and is now openly using the phone while you are teaching.

	Inappropriate	Somewhat inappropriate	Somewhat appropriate	Appropriate
Go to get assistance from a senior member of staff	☐	☐	☐	☐
Ignore that Mark is using his phone and continue with the lesson	☐	☐	☐	☐
Ask Mark to put the phone away again, but more sternly	☐	☐	☐	☐
Give school sanctions for having a mobile phone in class and for refusing the teacher's instruction	☐	☐	☐	☐

How appropriate are the following responses?

Fig. 5 Example of a video-based SJT from teacher selection project.

(2019, 2021) found that it was rare for teacher education programs to be built on methods with a published evidence base (i.e., using SJTs, MMIs, or other evidence-based methods) but research on using SJTs for selecting teachers is gradually emerging, with most studies in the last decade coming from the Teacher Selection Project group in the UK (<https://www.teacherselect.org/>), and some from the Teacher Capability Assessment Tool in Australia (e.g., Bowles et al., 2014). Results from research in the UK (Klassen et al., 2014) showed that SJTs administered to primary and secondary teaching applicants were generally well-received, with applicants for both primary and secondary programs expressing favorable opinions of the test. Two additional studies showed that SJTs administered at the point of selection successfully predicted performance in the second stage of selection (Klassen et al., 2020) and up to 6 months into teacher training (e.g., Klassen and Rushby, 2019).

Linking desired competencies to the content of teacher selection SJTs begins at the very beginning of the development process. Although SJTs have been criticized for their lack of clearly defined factor structure, largely due to the verisimilitude and complexity of the scenarios that make up the heart of the method (i.e., multiple constructs are represented in the “real-life” scenarios), key non-academic competencies form the foundation of the method. Multiple steps are involved in developing SJTs, including selecting and defining the key non-academic competencies on which to build the test. Klassen et al. (2017) described four steps in the development of an integrated (inductive and deductive) preservice teacher SJT:

1. **Teacher observation.** A job analysis is conducted through shadowing an early career and mid-career teacher in order to ground the research team in a shared understanding of the activities and tasks involved in a teacher’s day.
2. **Focus groups and individual interviews with stakeholders.** Step 2 involves an inductive approach to identify the key competencies needed for successful preservice teaching. Focus groups with experienced teachers and teacher educators are used to generate and discuss key competencies (e.g., *What are the individual characteristics you see in successful preservice teachers?*).
3. **Research review and creation of target competencies.** In this phase relevant research outlining key competencies (i.e., exploration of research examining non-academic predictors of teacher effectiveness) are added to the mix of competencies identified in the previous step to form a comprehensive list of target competencies.
4. **Review of target competencies.** In this phase, the inductively-derived (from focus groups) and deductively-derived (i.e., from research review) competencies are integrated to form an initial set of competencies used as a foundation for building SJT content.

Following the steps of SJT development, Klassen et al. (2017) identified three clusters of competencies: *empathy and communication*, *organization and planning*, and *resilience and adaptability*. Each of the SJT items, formed through a critical incident process, was built on one of these three competency clusters. After development, the teacher selection SJT was pilot-tested on incumbents and after revision, used for “live selection” as a screening tool (Klassen et al., 2020). In general, SJTs are most often used for large-scale screening rather than for more intensive selection purposes, for which approaches such as *multiple mini-interviews* (MMIs) are more appropriate.

Multiple mini-interviews for teacher selection

Traditional interviews (i.e., low-to medium-structured format with a high degree of interviewer flexibility) are one of the most used formats for selecting candidates into teacher training in some settings (Davies et al., 2016), but are generally labor-intensive and poor predictors of subsequent performance (Dana et al., 2013). One of the more recent developments in recruitment research is the development of multiple mini-interviews (MMIs), a method that has been widely used for selection into medical education (e.g., Eva et al., 2019) and more recently for selection into teacher education (Metsäpelto et al., 2020). MMIs used for selection into teacher education can be built on core competencies and are shown to be more reliable, valid, and fair than interview methods used in the past.

MMIs were developed by Eva et al. (2004) in an attempt to improve the fairness of the interview experience for applicants to medical school. The distinguishing features of MMIs (compared to traditional interviews) are that they use independent, highly-structured stations with scoring protocols that are also highly structured. MMIs, by definition, include multiple stations (from 3 to 10), each targeting a particular non-academic competency. Each station is independent and interviewers do not have knowledge of the interviewees’ profiles or performance in other stations, and the station content and scoring protocols are highly structured with standardized scoring schemes. MMIs are typically co-developed by experts with a diverse group of program staff who first identify the key target competencies, and then develop and test stations designed to assess these competencies.

Similar to the SJT development process, there are multiple steps involved in the development of a competency-based MMI for selecting teacher candidates:

1. **Identify key competencies.** This first step involves a series of focus groups and individual interviews with reference to relevant research (i.e., on competencies related to success in teacher education programs), policy documents, and program goals all under consideration. Ideally, a set of 4–8 key competencies are identified for consideration (e.g., empathy, professionalism, communication, diversity and social justice, mindset, and teacher beliefs).
2. **Assessment of interview logistics.** In this step, the logistics of the MMIs are considered, with questions about the number of applicants and available resources needing consideration, as well as the number of stations that can be accommodated (typically 4–8 stations in total).
3. **Station-writing workshops.** Each station is created to target one of the key non-academic competencies. Activities may include card-sorting, discussions with picture stimuli, simulated classroom situations, and structured interviews.

4. **Scoring guide development.** A systematic and detailed scoring rubric with positive and negative indicators is developed for each station task along with a summary of each station task, a list of specific questions to be asked and additional prompt questions, and a scoring rubric
5. **Pilot testing and review.** In this step, the MMI is pilot-tested with a small group of incumbent students with changes based on feedback from students and examiners regarding content and logistics.

MMIs provide an in-depth, competency-based approach to in-depth interviews, and as such, are an ideal complement to SJTs for larger-scale screening. The work conducted in Finland (Metsäpelto et al., 2020) and in the UK by the Teacher Selection Project provides the first examples of a competency-based and validated approach to in-depth teacher selection approaches. Using evidence-supported methods such as SJTs and MMIs represents a positive change for education organizations, but the implementation of competency-based recruitment methods takes careful planning and testing of the methods to be implemented.

Implementing a competency-based approach for selecting teachers

There are two key questions to answer when developing a competency-based recruitment and selection program (see Fig. 6). The first question posed by an education organization is, *What are the key competencies that we should target in our recruitment program?* The question is not trivial, because the competencies considered at this stage will potentially influence the attraction, selection, and development activities in the program. There is no single set of competencies that fits all organizations: an ITE program attracting and developing teachers for rural and remote Australian schools may choose to focus on competencies that reflect the unique challenges of the target context (Durksen and Klassen, 2018). These key competencies can be chosen through a review of research and theory on teacher effectiveness (i.e., top-down or deductively), and through a consideration of the particular foci and themes of the organization (i.e., bottom-up or inductively). The choice of key competencies can be developed using an integrated deductive and inductive approach, where research- and theory-supported competencies are integrated with the competencies developed through an inductive data-gathering phase (e.g., see Klassen et al., 2020).

The second question to consider during the implementation phase is how to develop reliable, valid, and unbiased methods to evaluate these competencies. The second question posed by the organization is *What selection methods should be considered?* and, *What is the research evidence for their effectiveness?* Constraints related to resources (i.e., time, space, personnel, cost) play a part in determining the viability of selection methods, but *status quo* approaches (e.g., depending solely on academic records, personal statements, and conventional interviews) have been shown to be ineffective in teacher selection (Klassen and Kim, 2019, 2021). The key factors to consider by an organization in implementation are first, working together to establish a set of agreed-upon competencies, and second, considering the best (reliable, valid, and viable) ways to evaluate these competencies. Recent research in medical education shows that selection tools such as SJTs and MMIs are preferable to more traditional methods (Patterson et al., 2016). Including the assessment of a range of competencies using multiple methods at each point in the recruitment process increases the likelihood of predicting future success in any professional field (e.g., Lievens and Sackett, 2017). Implementing tested and validated recruitment methods provides an effective and efficient way to improve the teacher workforce; building research-supported recruitment programs can provide lasting benefits to organizations and education systems.

Conclusion and next steps

In this article, we have considered how a competency-based approach to teacher recruitment—attraction and selection—can lead to improvements in the teacher workforce. The recruitment challenges facing educational organizations are real: recruiting the best

Fig. 6 Choosing key competencies and evidence-supported methods.

possible teachers represents a complex multivariate problem, but recent advances in research and theory can contribute to solving recruitment problems. For educational organizations, the adoption of a competency-based approach coupled with the use of recent methodological innovation can provide a “quick win” to strengthening the teacher workforce, with the additional advantage of providing a reliable and valid approach to recruitment and selection.

We suggest that the next steps for research on competency-based approaches to teacher recruitment will focus on:

1. **Building a better understanding of key competencies.** Cross-cultural work exploring the universality and cultural specificity of key competencies associated with effective teaching practices. Limited work has been conducted in this area, and although some competencies are universal—empathy and resilience, for example—the salience of some competencies varies according to context (e.g., Klassen et al., 2018). From a research standpoint, understanding how individual characteristics might vary across contexts is of real interest; from an applied standpoint, understanding which competencies should be targeted during recruitment, and how these competencies might change over time and place is important for the development of recruitment activities.
2. **Development and testing of innovative recruitment methods.** Although many educational organizations moved to online recruitment during the COVID-19 pandemic, potential technological advances in recruitment go far beyond online delivery. One potential area for growth is *gamified assessments* (serious games) that incorporate gaming elements in non-game contexts (e.g., Woods et al., 2020). For example, SJTs and RJP's can be “gamified” by placing prospective teachers in a virtual school classroom using virtual reality technologies, and work on “branched” scenarios can provide a more interactive and tailored selection process (e.g., Reddock et al., 2020). Current work on branched scenarios for teacher recruitment and development is taking place in Australia by researcher Jade Rushby and colleagues at UNSW. One immersive virtual teaching environment is SimLab, developed in the US (<https://kognito.com/>) and recently piloted for teacher education at Murdoch University in Australia (Ledger and Fischetti, 2020). In the last few years, advances in virtual reality and simulated teaching environments have spurred on new ways to select prospective teachers (e.g., Ke and Xu, 2020), and we expect teacher recruitment methods to be influenced by these innovations.
3. **Improving the recruitment (attraction and selection) of school leaders.** An important, but largely neglected, area of growth is the recruitment of school leaders. We see a worldwide shortage of high-quality school leaders and current recruitment processes can be arbitrary and opaque (Yang et al., 2021). Lessons learned from teacher recruitment (e.g., building from a foundation of key competencies, using evidence-informed methods, measuring the validity of methods) can improve the approaches used to attract and select prospective school leaders.

Final thoughts

Recruiting the next generation of teachers presents an opportunity to positively influence the educational outcomes of children and adolescents around the world. A carefully constructed, tested, and refined teacher recruitment program identifies key teacher competencies and uses the best possible methods to recruit and retain outstanding teachers. In this article, we have argued that working to build the best possible recruitment programs is a worthwhile endeavor that has often been neglected in education. Efforts to build a rigorous and robust recruitment program will pay off with a stronger teacher workforce, a higher quality education system, and a more productive and prosperous society.

Introduction

Today, professionals from different areas are expected to keep up to date with the most recent developments in the field and continuously develop their knowledge and skills. This reality has also changed the perception of who a professional is and in fact has started to define it. While in the past, in many areas, basic knowledge and key skills could be acquired during initial training, and this knowledge may have been enough to pursue a lengthy career in a field, nowadays this is no longer possible. Today we assume that every professional, including a teacher, is a “learning professional” (Simons and Ruijters, 2014). More specifically, Simons and Ruijters point out that being a professional demands two moral requirements: commitment and integrity. These two moral requirements are necessary to develop four qualities of a professional: body of knowledge, theory of action, field of expertise, and engagement in professional community. All these relate to different ways of learning and results in two benefits for a professional: autonomy and authority. In the case of autonomy, teachers can make decisions about their work and professional development, and with authority they can contribute to the development of the profession, train novice teachers and experienced colleagues, and advice the general public.

The model of the “learning professional” requires a teacher to take an active role both in their daily work and in shaping the teacher profession more broadly. This active role can manifest itself in commitment, purposiveness, intentionality, and influence, as well as resisting or transforming existing practices. This manifestation has been conceptualized as human agency (Archer, 2000; Emirbayer and Mische, 1998; Eteläpelto et al., 2013; Moate and Ruohotie-Lyhty, 2014). As I will elaborate in the next sections, agency can derive from individual capacities but can also be supported or hindered by structural, cultural, or even material conditions in the environment (Priestley et al., 2015). As such, it is very important to understand how teacher's work is guided and structured by educational policies, legislative frameworks, and everyday practices as well as how teachers enter into the profession in the context of initial teacher education. Drawing on our previous publications (Leijen et al., 2020, 2021), this article will propose how to understand student teacher agency and how to support developing agency in the initial teacher education context.

Teacher agency

The concept of agency is closely related to identity, and from a broad understanding identity refers to who the person is. Agency, subsequently, indicates what a person does—taking an active role and influencing realities. Different research traditions conceptualize agency differently. For example, psychological traditions tend to view agency as a characteristic or capacity of a person. Related to this approach, Bandura (2009) defined human agency as “the human capability to exert influence over one's functioning and the course of events by one's actions” (p. 8). This indicates that one's actions depend primary on their personality and individual capacities, e.g., how determined one is, which concrete skills or knowledge one has, or which beliefs one carries. On the other hand, sociological, socio-cultural, and pragmatist traditions emphasize the relationship between the person and environment and argue that what a person does cannot depend only on the persons themselves but also on the environment around them. Followers of the socio-critical tradition seek for possibilities to change certain social structures and deliberate individuals and groups from their influence. Followers of the socio-cultural and pragmatist approaches do not address the influence of structures and systems so radically, rather, they see human agency as something that is made possible by the environment. Socio-cultural approaches tend to stress the mediated nature of agency, focusing on how contexts and cultural tools shape human beliefs, values, and activities (Lasky,

2005; Wertsch, 1993). However, the socio-cultural approaches are not uniform, and some authors neglect individual agency in theories of object-oriented activity while others focus on active agency while accepting interdependence with the social context (see Eteläpelto et al., 2013 for an overview). Drawing on the latter approach, Juutilainen et al. (2018) and Lipponen and Kumpulainen (2011) emphasize the social and contextual factors in developing student teachers' agency based on their qualitative research studies. Similarly to the subject-oriented socio-cultural views, the approaches derived from pragmatism focus primarily on the person's temporary constructed engagement with the environment and define agency as a potential to act by means of the environment (Biesta et al., 2015). The attainment of teacher agency is influenced by individual efforts, resources, and cultural and structural factors as shown in several empirical studies guided by this approach (Leijen et al., 2021; Oolbekkink-Marchand et al., 2017; Oosterhoff et al., 2020; Priestley et al., 2015).

Since it is important to understand how agency is achieved by student teachers from a broad perspective and what can facilitate or hinder this process in the teacher education context, I will proceed from the pragmatist approach and elaborate on an ecological model related to this tradition more thoroughly.

Ecological model of teacher agency

Drawing on the earlier work of Emirbayer and Mische (1998), Priestley et al. (2015) proposed an ecological model that describes the achievement of agency as a temporal-relational phenomenon through three dimensions: iterational, projective, and practical-evaluative. Firstly, the iterational dimension indicates that agency is rooted in past experiences. Thinking about teachers, we can see that their activities are influenced by their knowledge base, which contains personal life histories and also knowledge, attitudes, and skills acquired during teacher education and in their work context. In a way, the iterational dimension of agency guards for stability in teacher's actions since teachers tend to repeat activities that have proven successful in the past. Secondly, agency is oriented toward the future. The projective dimension contains short-term and long-term purposes which allow to shape actions in line with a teacher's plan for the future; thus, guarding for potential change in teacher's actions. Thirdly, the practical-evaluative dimension entails teacher's capacity in a present situation to make decisions for action. This decision-making process entails that a teacher considers alternatives for action, which are on the one hand guided by the iterational and projective dimensions and on the other hand by the cultural, structural, and material conditions, which could be enablers, constraints, or resources for action. For example, horizontal relations and close ties among teachers, as well as student teachers, can function as enablers of agency (see Juutilainen et al., 2018), while performance-oriented culture and hierarchical relations among people can act as constraints for teacher agency as noted earlier (see Priestley et al., 2015). Therefore, a student teacher achieves agency when they can consider alternatives and is able to judge which of them would be the most appropriate in a given practical situation in light of their greater professional purpose and competency base. "Agency is not present if there are no options for action or if the teacher simply follows routinized patterns of habitual behavior with no consideration of alternatives" (Priestley et al., 2015, p. 141). In the next section, I will further analyze this model and discuss how to support teacher agency in the context of initial teacher education.

Supporting teacher agency in initial teacher education

Below I will highlight a few ways how student teacher agency could be strengthened across these three dimensions of the ecological model: iterational, projective, and practical-evaluative.

Competency base

One of the oldest tasks of initial teacher education is developing student teachers' competency base. This is often addressed through foundation courses on subject disciplines as well as courses on educational psychology, sociology of education, and more practical methods courses which focus more concretely on mastering teaching activities. Therefore, on the one hand, initial teacher education emphasizes the value of formal knowledge which is important for providing perspectives and concepts for teachers for understanding their work (Biesta et al., 2015). On the other hand, it is important to support developing student teachers' practical knowledge (Darling-Hammond et al., 2005; Jensen et al., 2018; Meijer et al., 2002) to make learning experiences more personal and meaningful. What is crucial regarding both formal and practical knowledge in relation to agency is making it explicit and therefore more useable while constructing different alternatives for action. Developing formal and practical knowledge regarding teachers' work has, for a long time, been the main focus of teacher education. More recently, initial teacher education has started to emphasize student teachers' self-knowledge (Fairbanks et al., 2010), their strengths, and core qualities (Korthagen and Vasalos, 2005) as resources for professional work. This means that teacher education needs to provide space for exploring one's personal identity and for exploring the relationship and fit between their professional and personal competences (Anspal et al., 2019; Leijen et al., 2018).

In our teacher education context, we have encouraged student teachers to voice their strengths, beliefs, and values regarding education in individual assignments and asked them to explore where these come from. We have also asked them to describe their role models and professional role expectations following teacher standards. Moreover, we have asked student teachers to explore how their personal competencies fit with the role expectations and which aspects they would like to reach a better fit. These assignments are carried out alongside assignments focusing on professional purposes.

Professional purpose

Research has shown that long-term purposes are not often visible in teacher's work (Priestley et al., 2015) and not consistently considered by student teachers (Leijen et al., 2021). This indicates that a professional vision has remained implicit in many teacher education programs and perhaps stayed in the shadows of professional competences. There are, however, several scholars (Feinam-Nemser, 1990; Hammerness, 2006; Klette and Hammerness, 2016) who have argued for the importance of articulating a vision for a teacher education program and carrying it throughout different activities. These authors stress that a program vision should be visible from program documents such as course outlines, shared among the teaching staff, including the mentor teachers from practice schools, and embedded in different teaching and learning activities. Making the vision of teacher education program explicit also helps to model the importance of wider purposes in education for student teachers. Biesta (2009) has proposed three broad purposes of education: qualification, socialization, and subjectification (becoming a subject) which could be used as a wider frame for specifying more concrete long-term and short-term purposes of teacher education and consequently also for education in general. We have argued (Leijen et al., 2020) that besides these normative purposes of education articulated from the learner's perspective, student teachers need space for formulating more personal long-term purposes as well (Damon et al., 2003; Tirri et al., 2019). Finally, similarly as exploring the alignment between personal competences and professional role expectations, student teachers can be guided to synthesize their unique professional purpose.

In our context, we have encouraged student teachers to think about their own vision of education by paying attention to the three dimensions: focus, range, and distance as proposed by Hammerness (2003) in individual assignments. Following, we have asked student teachers to consider the three broad aims of education proposed by Biesta (2009), analyze how purposes are formulated in legislative frameworks and teacher standards, and finally to explore how well their personal vision is aligned with the professional purposes of education and whether they wish to increase the coherence between some aspects. Following these individual assignments, we have asked student teachers to reflect on their competence base (see previous section) and purposes and create a digital story about who they are and what their pedagogical vision is and to share this within a homegroup (voluntary formed group of 6–8 student teachers). Student teachers do these assignments at the end of the base module of teacher education. We see, however, that it would be useful to return to these assignments after some time e.g., once in a semester.

Environmental conditions

Although individual characteristics such as competencies and purposes are very important for teacher agency, these are not sufficient in case the environmental conditions, such as cultural, structural, or material, are limiting or restricting teacher agency. Starting from cultural conditions, it is evident that collaboration-oriented cultures are supporting teacher and student teacher agency. For these reasons, collaborative activities and student teachers' learning communities are recognized as an important context for sustaining and strengthening student teacher agency (Juutilainen et al., 2018; Lipponen and Kumpulainen, 2011; Toom et al., 2017; Vähäsantanen, 2015). More specifically, Juutilainen et al. (2018) showed that student teacher agency is supported by well-functioning peer groups where members feel emotionally safe and respected. A lack of emotional safety, unequal treatment, and comparisons between peer groups restricted student teacher agency. The latter indicates that a competition-oriented culture lowers trust and can raise anxiety among student teachers. For these reasons, it is not recommended to promote comparisons and competitions in a teacher education context and in an educational context more generally (see also the works of Pekrun (2016) regarding academic emotions). A collaboration-oriented culture in an initial teacher education setting also necessitates supportive relationships between teacher educators and student teachers. Core reflection, proposed by Korthagen and Vasalos (2005), and video-based guided reflection, developed in a context of an international project called ACITEA (Allas et al., 2017, 2020; Husu et al., 2008; Knezic et al., 2019; Toom et al., 2019), are good examples of reflection procedures that can be used by mentor teachers to empower student teachers. Although these procedures are different in terms of what is seen as the major resource for understanding and solving pedagogical situations (personal strengths and core qualities in the case of the former and theoretical knowledge and concepts learned during teacher education in the case of the latter), they both aim to empower student teachers and foster developing their views and voices in dialog with a mentor teacher or a peer student. This leads to structural conditions which support student teacher agency. Priestley et al. (2015) found that horizontal, reciprocal, and symmetric relations between staff are supporting agency where hierarchical and asymmetric relations between staff members are limiting teacher agency. Similarly, Juutilainen et al. (2018) showed that in order to support student teacher agency in initial teacher education context, it is important to break traditional teacher-students authority relationships. Other examples of structural conditions are, for example, the systems implemented to monitor and control educational practices. Regarding this, formative assessment with feedback from peers and teacher educators and reflection assignments are supporting student teacher agency while summative assessments leave less room for this.

The above-described possibilities to support teacher agency focused on the level of teacher education programs. We should also consider the macro level cultural and structural conditions and their influence on meso and micro levels (see for example a study conducted by Tinn and Ümarik (2021)). For example, some countries have a stronger competition- and performance-oriented culture than others. An example can be seen in countries where schools and universities are ranked in league tables. Or countries where regional level competitions for different areas are organized, targeting individual teachers, schools, and also individual pupils and students. There are also considerable differences between countries and regions regarding macro level structural condition in terms of monitoring and controlling teachers' work and related to material conditions of teachers work. The 2020 TALIS report (see OECD, 2020) showed that several countries who are known for a strong performance-oriented culture in education, such as

Singapore, Estonia, England, and the United States, reported high percentages (24% and above, OECD average was 16%) of young teachers wishing to leave the profession. This despite students of these countries often doing very well in international comparison tests such as PISA. Among other aspects, these tests also indicate that teachers are competent in their job. Contrary to these countries, only 10% of young teachers in Finland indicated they would like to leave the profession in the coming 5 years. Although this could be related to a high quality teacher education, it most probably also reflects the contextual factors of teachers' work. For example, although country level results about pupils' performance are collected in Finland, these results are only used for feedback purposes for individual schools and are not made publicly available. Similarly, teachers in the Finnish context are trusted and are not monitored by external evaluators.

Besides paying attention to how we can support student teacher agency in initial teacher education, we should also encourage student teachers to learn how to notice different aspects of their environment. Noticing different aspects of one's environment, alongside professional language and concepts (Biesta et al., 2015), is a prerequisite for being able to start negotiating work conditions with colleagues and policy makers. For these reasons, we proposed (Leijen et al., 2020) to distinguish between noticing (perceiving) and interpreting while evaluating environmental conditions prior to deciding for action in teacher education context (see Fig. 1 which captures the ecological model of teacher agency). Video-based reflection procedures (e.g., ACTEA mentioned earlier) have shown positive results to expand student teacher's scope of noticing in analyzing pedagogical situations (see e.g., Allas et al., 2020) and guidance procedures with peer students and mentor teachers have also shown positive results regarding developing practical knowledge and linking it with theoretical concepts (see e.g., Allas et al., 2017; Knezic et al., 2019).

In brief, while discussing how to strengthen student teacher agency across its three dimensions, we have shown how reflection and collaboration with peers and mentors can foster agency. In terms of types of reflection (see Leijen et al., 2020 for a more extensive overview) these examples have mostly covered supporting reflection-in action (also referred to as technical reflection) which is utilized in the decision-making in practical situation and reflection-on action (also referred to as practical reflection) which is conducted retrospectively. Both technical reflection and practical reflection foster learning about teacher's work within cultural and structural conditions. The third type, critical reflection, is needed in case we wish to guide more deep questioning of existing cultures and structures, reveal assumptions and values, which underlie people's actions and decisions, and propose alternatives. Mezirow's (1991) guide for transformative learning that was developed for the adult learning context could be useful for that purpose. This time-consuming and resource-intensive procedure is especially valuable to initiate deeper changes in groups of student teachers.

We have explored ways how to support teacher agency in today's initial teacher education. Some ways how student teacher agency dynamics could be noticed and assessed in the context of their initial education will be considered in the final section of this article.

Fig. 1 Model of the formation of teacher agency. Based on Leijen et al. (2020).

Noticing and assessing student teachers' agency in initial teacher education

Most studies on teacher agency are qualitative. Several studies have investigated how to notice signs of student teacher agency. For example, [Juutilainen et al. \(2018\)](#) found that student teacher agency is manifested in evolving understandings, contesting prevalent views, and experiencing change in thinking. Similarly, [Lipponen and Kumpulainen \(2011\)](#) identified different forms of agency that emerged in the collective discussions of the classroom community evidencing pre-service teachers' transformative agency (making considerable changes in thinking and acting), relational agency (being able to utilize the support given by others as well as being a resource for others), and epistemic agency (taking responsibility over one's own learning). Somewhat differently, [Ukkonen-Mikkola and Varpanen \(2020\)](#) identified professional competence, reflection, and working with others as different dimensions of professional agency.

Some studies have also utilized questionnaires to investigate student teacher agency. For example, [Soini et al. \(2015\)](#) and [Toom et al. \(2017\)](#) investigated student teacher agency using an instrument previously developed for in-service teachers: the Teacher's Sense of Professional Agency survey (TPA) ([Pietarinen et al., 2013](#)) that focuses on motivation to learn, efficacy beliefs about learning, and intentional acts for facilitating and managing learning in the classroom. [Toom et al. \(2017\)](#) proposed a five-factor model of student teacher agency and found that first year student teachers in a Finnish university context had relatively high scores of agency. More specifically, they expressed a strong sense of community, found feedback useful for developing their instruction, practiced active help-seeking to develop their instruction, appreciated school development work, and somewhat less also appreciated collective efficacy. [Jääskelä et al. \(2021, 2017\)](#) proposed a more detailed scale for studying university student' agency, which could also be used in initial teacher education. Their instrument distinguishes between individual resources (interest and motivation, self-efficacy, competency beliefs, participation activity), relational resources (equal treatment, teacher support, peer support, trust), and contextual resources (opportunities to influence, opportunities to make choices) of student agency and suggests monitoring these in different university programs.

Both above-described instruments seem to focus mostly on student teacher's competency base, including knowledge and affective-motivational competences and beliefs, environmental enablers of agency, and relational aspects of agency. For our study of student teacher agency ([Leijen et al., 2021](#)), we developed a questionnaire based on the ecological model of agency to capture student teachers' competency and self-efficacy beliefs, professional purposes, and school level environmental enablers and resources of agency in three domains: planning of teaching and learning activities, teaching diverse ability students in the same class, and using ICT in teaching. These distinct areas were selected because agency is domain specific, and these domains represent different important aspects of today's teachers work. Planning of teaching and learning activities could be understood as a traditionally important activity teachers need to carry out. Teaching diverse ability students and utilizing ICT in teaching could be understood as a recently increasing demand describing teachers' work in many countries. Regarding each domain, the questions were similar. The 3 times 10-item questionnaire proved reliable and valid since we could confirm the previously proposed three dimensions of agency regarding all three domains. Based on an empirical study conducted in the Estonian context, we saw that students reported the highest agency related to planning of teaching and learning activities. We found statistically significant differences between student teachers with different teaching experience, whereas less experienced teachers had lower agency than more experienced teachers. More specifically, we found that gaining teaching experiences is positively related to two dimensions of planning related agency which target accumulated competences and professional purposes. The lowest agency among student teachers was reported regarding teaching diverse ability students in the same class. Moreover, gaining of teaching experience was not related to an increased agency in this domain, which could be explained by relatively late implementation of inclusive education in Estonia. Agency related to utilizing ICT in teaching was also relatively high, moreover younger students had higher agency in this area. However, student teachers evaluated their competences and environmental conditions higher than their purposes related to using ICT for teaching and learning, which brings back the importance of pedagogical vision and long-term purposes of education. Although these results were very informative, the formulation of items might be somewhat too general. For example, in the current version we have a general question about long-term purposes of a teacher, but we do not specify different long-term goals as elaborated above ([Biesta, 2009](#)). Therefore, we are currently developing a new instrument with more specifically formulated items. In future studies we would like to compare these instruments and find out whether they are both suitable for monitoring teacher agency dynamics in initial teacher education and during the professional career as a teacher.

Conclusion

This article explored how to conceptualize teacher agency and how to support and assess it in initial teacher education context. I showed that thinking about one's own and others' intentions and activities and creating a broader meaning about them is an important condition for achieving agency. As we have seen from this article, decision-making and acting on them is not solely dependent on an individual student teacher but reflecting will certainly help to better understand the situation, which is a prerequisite to start negotiating conditions and implementing changes in one's environment. Major structural and cultural changes are difficult to achieve as an individual, which is why it is very important to collaborate with others. Collaboration is also more likely to lead to collective agency, showing teachers actively guiding and shaping their daily work and teaching profession more broadly. This idea brings us back to the model of the "learning professional" which was introduced at the beginning of the article.

Acknowledgment

I would like to thank student teacher and teachers who have shared their conceptions and experiences in different studies which this article is largely based on. I would also like to thank colleagues and students for their insights and contributions in studying teacher agency.

Introduction and historical overview

The concept of identity has wide application across all landscapes in education research: we talk of learner identities to help us understand the learning pathways of children and young people; we talk of institutional and community identities to understand the distinctive practices and beliefs in schools, colleges, districts or universities, and we talk of professional identities to understand the particular characteristics and responses of both the teaching profession as a whole and of individual teachers or subject specialist groups. As a complicated construct, identity research is rooted in disciplines as diverse as philosophy, anthropology, sociology, psychology, education and political science. Each brings a distinct disciplinary framework, history, and discourse, which makes research into the professional identity of educators a complex and multi-faceted area of study. Multiple disciplinary approaches are evidenced, even when research is focused on teachers at a particular career-stage e.g. [Leeferink et al. \(2019\)](#); [Joseph \(2019\)](#); [Ritacco and Bolivar \(2019\)](#); on teachers working in particular subject areas (e.g. the [Widodo et al. \(2020\)](#) study on language teachers or [Karaolis and Philippou \(2019\)](#) and [Boaler \(2003\)](#) studies on mathematics teachers), and on the wider population of teachers (e.g. [Berger and Lê Van, 2019](#)). In its broadest sense, research on teachers' professional identity seeks to explain how teachers are positioned by, and come to position themselves in relation to, the cultural and social worlds they experience. In exploring the interface between teachers, their teaching environments and wider lives, professional identity offers the potential to contribute to our understanding of teacher professional development, teacher efficacy, agency, resilience and retention, and through these, inform our understanding of how to frame effective education policy, school leadership and curriculum guidance.

In this article we provide a brief historical overview of research on teacher professional identity before highlighting some current empirical studies and research themes. We explore professional identity as a dichotomy between rationalist and affective models of professionalism, arguing that an attempt to consolidate the rationalist/affective nexus allows for a more holistic and education-focused approach to teachers' professional identity. We then illustrate the possibilities of crossing the reason-emotion divide in professional learning and knowledge development.

The roots of much empirical identity research lie in social psychology and anthropology. Both disciplines seek to understand the intersection between the personal world of individuals and the collective meanings, social relationships and histories of the communities in which those individuals live and work. As a social psychological concept, identity research helps explain some socio-cognitive processes of teachers' professional development and some of the psychodynamic processes that arise from being a member of a professional group (see for example, [Clandinin et al., 1999](#)). As an anthropological concept, identity studies describe how individuals draw on cultural resources to make: "sense of" (about) themselves and represent the dilemmas of their social situations "for themselves" ([Holland et al., 2001](#), p. 8). Current social psychology and anthropology research perspectives suggest that identity is fluid, a fundamental act of being and a dynamic process that requires internal agency. It is malleable, shaped by social structures, interactions and experiences, but also exerts its own social and personal influence: "People tell others who they are but more importantly, they tell themselves, and they then try to act as though they are who they say they are" ([Holland et al., 2001](#), p. 3).

Over time, research on teacher professional identity has evidenced a gradual shift from static perspectives in which identity was used as a concept to capture the teaching profession's beliefs, values, and practices toward poststructuralist understandings of identity as a dynamic and fluid construct. [Beijaard et al. \(2004\)](#) undertook a systematic review of early research on teacher professional identity and noted that many early studies adopted a cognitive focus that positioned professional identity as the personal practical knowledge of teachers rather than a socially-negotiated construct. Psychological studies of teachers interpreted professional identity as an "image of self" that determines how teachers teach and respond to educational change whereas studies of teacher education linked professional identity to the teachers' professional roles or to processes such as reflection and self-evaluation. Both kinds of study assumed that professional identity was relatively stable and a stabilizing influence. In contrast, more recent research views professional identity as fluid, social, multifaceted, linked to learning, to affect and to feelings of belonging, and that it is "neither intrinsically stable nor intrinsically fragmented ... [but] more, or less, stable and more or less fragmented at different times and in

different ways according to a number of life, career and situational factors.” (Day et al., 2006, p. 601). Although a systematic review of recent research on student teachers’ professional identity (Rodrigues and Mogarro, 2019) uncovered a range of definitions and investigative purposes for studying identity, there was wide agreement that identity is malleable, “formed through socio-cultural situated practical experiences and depends on the complex negotiation between professional experiences and external factors.” (Rodrigues and Mogarro, 2019, p. 6). This shift is evidenced in social psychology frameworks that seek to understand how identity contributes to teachers’ sense of: belonging (see for example, Brown and Everson, 2019); their emotional engagement in teaching (see for example, Wang et al., 2019; Nichols et al., 2017), and their professional knowledge and craft (see for example, Leeferink et al., 2019). It is also evidenced in anthropological frameworks that describe how interactions between culture and agency shape how teachers think, feel, act and learn (see for example, Sachs, 2001), and in sociological frameworks that chart the impact of power dynamics and social positioning on teacher identity (see for example, Moghadam et al., 2020; Day et al., 2006). Despite these common understandings, Rodrigues and Mogarro (2019) argue that identity research in teacher education is “still hostage of the other social sciences,” and that “a unique and distinct discourse within teacher education has not yet been developed.” (ibid 2019, p. 10).

Professional identity and professional learning

A unique discourse for education must draw on affective and cognitive views to explain the power of both individual agency and institutions to shape professional identity and professional learning. The concept of “communities of practice” (Lave and Wenger, 1991) offers an explanation of how professional identities are forged from the social interactions between community members who share a common interest and competence. It suggests that shared knowledge and informal, situated learning are negotiated through joint activities so that the community grows, legitimates and regulates the knowledge, values, skills, resources, and know-how of individuals. Apprenticeship into the community begins with legitimate peripheral participation, following non-linear pathways to full participation and acceptance into the community. Wenger (1999, 2010a) argues that this social participation and informal, work-based learning allow identity to be negotiated through words and actions, as individuals work out “ways of being a person in that context” (Wenger, 2010a, p. 133). Boaler (2003) refers to this as a “dance of agency” that requires active engagement in community practices, histories, learning and stories, alongside some compliance to community norms and practices and to the hierarchies of power. Wenger-Trayner and Wenger-Trayner (2015) suggest that multiple communities of practice, including policy, regulatory and research communities, form a “landscape of practice”. Education professionals navigate this landscape, working across community boundaries to align different knowledge-domains within specific contexts to forge a meaningful moment of practice. Different alignments create the possibility of different actions and outcomes (which neatly explains professional innovation), but all alignment requires imagination to extrapolate experience across contexts and practical engagement. The “landscapes of practice” model suggests teachers do not simply “put theory into practice” and it positions teacher agency and identity as intrinsic to active knowledge-production. The concept of professional knowledge generated in a landscape of practice chimes with understandings of trans-disciplinary distributed “Mode 2” knowledge produced in its context of use (Gibbons, 2000). In this, it provides a model of teacher identity-work that does two things: Firstly it interweaves professional identity with narratives of *how* teachers come to know, and secondly, it harnesses professional identity to concepts of professional agency, reflection and knowledge through “engagement, imagination and alignment” (Wenger, 2010b, p. 184) in which teachers attune their practices to the needs of their students and the communities the school serves.

However, when professional knowledge, learning and identity are socially negotiated, the pathways to adaptive professional competence can seem opaque and uncertain. Practitioners may choose to resist, reshape or side-line new and potentially useful knowledge-communities (Farnsworth et al., 2016) or adopt intuitively appealing but ineffective practices. Education research to problematize and understand how professional identity operates to expand or inhibit professional learning, knowledge-formation, efficacy, and values in complex contextualized situations is vital. In some situations the desire to adopt a particular professional identity may inhibit learning, agency, enquiry, reflection and curiosity: Hall et al. (2012) report that student teachers in practicum schools were marginalized rather than engaged as the legitimate peripheral participants that Lave and Wenger (1991) suggest. Feeling too vulnerable to display uncertainty or to position themselves as learners, the student teachers forged narrow teaching identities that reduced professional competence to “class control” and children’s learning to “skill development”. Research into identity and professional values is equally complex and presents difficulties of identification and theorization. The theory of implicit bias, suggests that practitioners can harbor unconscious “discriminatory biases based on implicit attitudes or implicit stereotypes [which] ... can produce behavior that diverges from a person’s avowed or endorsed beliefs or principles.” (Greenwald and Krieger, 2006, p. 951). Murphy and Wyness (2020) report from England that teachers’ grade predictions for university admission are overwhelmingly optimistic for all socioeconomic groups except high-attainers from disadvantaged backgrounds, the only group significantly more likely to have pessimistic grade predictions.

Given such uncertainties, policy and regulatory communities in some countries have imposed competency-based or content-focused frameworks that centrally direct teachers’ professional actions and learning and do not engage professional identity. Such technical-rationalist innovations introduce standardized curricula, scripted teaching, high-stakes assessment or target-setting accompanied by standards-based managerialism and funding regimes (Hall and McGinity, 2015). The incongruity is clear: increasing attainment, social justice, equity, inclusion and wellbeing in different contexts requires responsive teachers who are noticing, creative, critical and inquiring, who bring agency, knowledge and expert judgment to adapt teaching practices, and

who challenge bias and learn in context. Contextual affordances and constraints may require professionals to adopt different pathways to a common outcome, top-down technical-rationalist interventions that impose a single pathway diminish those very aspects of professional identity - agency, reflection and criticality - that are necessary.

From identity research to a pedagogy of identity: the rise of identity work in teacher learning

Bensimon (2007) argues, albeit for higher education, that policy analysts' focus of attention on tuition policies, incentive funding, accountability and regulatory systems overlooks practitioner sense-making frames as institutional agents of change. Despite terms such as "self evaluation", "active reflection", "collaboration" and "peer regulation" entering the policy discourse (see for example OECD, 2019, 2020) we need better understanding of the kind of healthy professional identities that can do this, how they can be grown at scale across multiple contexts, and the kinds of learning, actions and values required to re-shape schools to deliver positive educational outcomes and social justice.

Whilst Rodrigues and Mogarro (2019) are right to argue that education research on professional identity has yet to hit its own stride, studies of identity formation do chart some of the tensions and contradictions at career transition points that impact identity and prompt professional learning (Gaudelli and Ousley, 2009). These highlight affective influences on the kinds of teachers that practitioners imagine themselves becoming (e.g. Dinham et al., 2017) and the kinds of discourse that affect teacher identity (e.g. Haniford, 2010). In policy studies on teacher stress and burnout professional identity both measures impact and can operate as a protective factor in how teachers internalize challenging work conditions, systems or environments (e.g. Kangas-Dick and O'Shaughnessy, 2020; Hong, 2010; Dassa and Derosé, 2017; Skinner et al., 2018; Nichols et al., 2017; Dinham et al., 2017). We know that moments of tension can prompt reflection and learning, but an overload creates anxiety and stress, impacting negatively on self-efficacy, professional learning and, ultimately, pupil attainment (Glazzard and Rose, 2020).

Research has identified some effective and ineffective features that promote professional identity and learning through mentoring (Orland-Barak and Wang, 2021; Anspal et al., 2019); course design (Alderton, 2020); system design (Hökkä et al., 2019); and self care systems (McKay, 2019). Specific pedagogical tools have been designed to prompt "identity work" in the form of deliberate, conscious reflection and engagement, to promote self-aware, noticing and adaptive practitioners. The studies tend to be small-scale but include identity-work tools such as: protocols for reflection (Pomerantz and Ippolito, 2015); auto-ethnography (Lavina and Lawson, 2019); collaborative reflection (Maclean and White, 2007); lesson study (Lieberman, 2009); action research (Estola, 2003; Webb, 2005; Cattley, 2007; Maclean and White, 2007; Vavrus, 2009) as well as case-study and focused experiential learning; professional (face-to-face and virtual) networks (Lundin et al., 2020). The concept of "ethical practitioner enquiry is underpinned by an epistemology which challenges both technical and practical views of education" (Lofthouse, 2014, p. 15) and necessarily engages with issues of power, identity, values, and socio-cultural context in order to avoid unwittingly reproducing problematic ideologies and practices.

Seemingly advocating for a critical approach to practice-based research and professional development, Lofthouse (2014, p. 17) states that "practitioner enquiry rests on the proposition that those in practice are able to take informed intentional actions, explore their effects and form judgments of their value" as part of the standard social practices in education. Here, exploring effects, if viewed in relation to questions of ethics, must engage with the social effects of teaching and learning practices on the lived experiences of learners and teachers alike. Both these social effects and the judgments that enquirers make, are thus evaluated in relation to the ideologies (dominant or not) that they represent or challenge. This article reveals that a critical approach that bridges rationalist-affective domains of being and doing are necessary for constructing teacher identities that are professionally *and* ethically driven.

As both a research methodology and a classroom pedagogy (for higher education student teachers and school-going learners), critical reflection thus becomes a useful means for identifying, interpreting, and deconstructing teacher identities in context (Avraamidou, 2019; Cochran-Smith et al., 2020). Critically reflective journal writing, framed by action research, critical practitioner enquiry, or autoethnography, enables this:

By looking at critical incidents and experiences (as texts) in relation to issues of power, teachers and students might interrogate the ways in which social and political power influence the everyday construction of individual identities, how individuals take up or resist hegemonic orders, and the ways in which individuals occupy positions of privilege and subordination at different times and in different spaces. (Student) teachers can record their own identity shifts over time, in relation to lived experience, using critical analytical tools such as critical discourse analysis (Fairclough, 2001) to reveal how their own experiences, uses of language, and ways of thinking are situated in systems of power. That power can be defined in relation to gender and sexual diversity, or other identity categories, and contributes toward (student) teachers gaining the confidence and social consciousness to construct more socially just identities for themselves

(Govender, 2019, p. 353).

Theoretical framework: rationalist and affective models for teacher identity construction

In this section, we briefly outline rationalist (derived from cognitivist understandings of professionalism and identity) and affective (associated with socio-cultural and poststructuralist understandings of professionalism and identity) models for teacher identity construction. This is followed by our attempt to consolidate these two models, and the divide they represent, into an integrated

model for teacher identity construction characterized by fluidity, critical reflexivity, and the understanding that identity and practice are intrinsically connected to issues of power. Where a rationalist model prioritizes teachers' identities as disciplinary experts and their practices as measurable against predetermined national standards (Edwards and Blake, 2007) by taking on cognitivist definitions of identity, an affective model foregrounds multiplicity, discontinuity, and sociality (Arvaja, 2016) by taking on a poststructuralist perspective of identity. In trying to consolidate these two seemingly disparate models, we offer an approach that sees teachers' identity construction as socio-culturally situated, pluridimensional, and as deeply bound to issues of power in and out of the classroom.

Rationalist models of teacher identity

From a rationalist, or cognitivist, understanding of teacher identity and professionalism, it becomes easy to identify and critique the characteristics of a "good" teacher. Such characteristics are described in varying detail across international educational policies through professional standards for teacher registration or regulation and the assessment criteria of teacher education programmes (Mockler, 2010; Buchanan, 2014). In this way, by articulating "good teachers" and "good teaching" in cognitivist, measurable ways (Benesch, 2018), emerging (student) teachers and teacher educators are at risk of reproducing established, naturalized, and sometimes problematic notions of teacher identity and practice (Edwards and Blake, 2007; Arvaja, 2016; Gonçalves et al., 2013). Across the literature, three main contributing factors can be identified in the process of "professionalizing" teacher identity: (1) teachers are constructed as disciplinary experts, (2) teacher competency and professionalism are conceptualized and driven by pre-determined professional standards issued by policy-makers, and (3) professional practice, as interconnected with professional identity, is legitimated through particular ways of doing evidence-based practitioner enquiry.

Firstly, if teachers, particularly in secondary schooling, are constructed as masters of specialist knowledge rather than practitioners of or agents acting *through* particular disciplines, they may also inadvertently become constructed as the sole intellectual authorities in the classroom. In this sense, teachers may see themselves as holders of knowledge obtained and validated through university degrees. In Freirean terms, this risks positioning both knowledge and teaching/learning in problematic ways: firstly by foregrounding knowledge over people, and secondly by positioning those people (teachers and learners respectively) as depositors and receptacles of knowledge rather than co-constructors of meaning (Moje, 2008).

Moje (2007, p. 1) raises this issue by questioning how teachers "deal with conflicts between the intellectual work of teaching content concepts and the moral work of teaching those content concepts to human beings ... with varying perspectives on the value of the content, varying skill sets and ways of knowing that they brought to their learning, and rich and full lives that might or might not intersect with the content under study." In this sense, the rationality of intellectual work without the affective consideration for ethics in education risks decontextualizing classroom content, pedagogy, and assessment. On the other hand, teachers who see themselves as experts of their discipline may also gain confidence and agency in their classrooms. Where literacy and language teachers, for example, situate their knowledge and practice in established theoretical perspective *and* as part of communities of practice, they can begin to make decisions about effective literacy and language pedagogy that resonates with their learners in meaningful ways (Ellis and Smith, 2017; Schneider Kavanagh and Danielson, 2020; Moje, 2008).

The second contributing factor to developing teacher identities involves how teacher competency and professionalism are conceptualized and driven by professional standards, often found in national policy and teacher education assessment. Because such standards are shaped by existing dominant ideologies, they can have a strong influence on how teachers regulate themselves and each other. Furthermore, teacher educators and experienced in-service teachers use these as assessment tools to provide new and student teachers with feedback on their performance and progression, socializing emerging teachers into potentially narrow versions of professionalism.

If these standards are conceptualized from a rationalist perspective, they can serve to narrow what counts as appropriate, professional teacher identities (Hall and McGinity, 2015). For instance, to what extent are innovation and creativity measured and awarded? What kinds of social consciousness in teaching and learning are prioritized or excluded? What version of professionalism is legitimated through policy documents and regulatory boards? And, what kinds of (inter)actions are considered "appropriate" within the frame of the standards that govern? These issues highlight the tension between teachers and broader educational institutions:

Teachers' professional identities are being reworked from inside and outside of the teaching profession. Teachers as professionals are increasingly subject to external standards and codes of practice while, on the other hand, they are struggling to construct their own professional identities by exercising their own agency, prioritising the needs and interests of their students and classroom interactions and promoting "appropriate" professional practice

(Gonçalves et al., 2013, p. 57).

Teachers must therefore navigate the contentious space between the personal and the professional. This is particularly true in contexts where national professional standards do not recognize how teachers' own value systems, cultures, and ways of knowing and how these impact on the identity-practice nexus. For example, if teachers' identities are homogenized through policy and regulatory processes, both the regulatory boards and teacher education institutions risk losing critical access to the productive power of

difference (of perspective, of approach, of interpretation, ideology, or of subjectivity) and overvaluing sameness (O'Connor, 2006). Edwards and Blake (2007) as well as Johnson and Golombek (2020) argue that it is the critical engagement with difference and diversity in teachers' identities, knowledges, and practices that drive education forward.

The third component concerns how teachers evidence and measure the efficacy of their own practice, through evidence-based practitioner enquiry, against policy requirements and dominant research. While the intention to engage teachers with this kind of reflective work "contends that the education of teachers can be realized neither through the delivery of a pedagogical blueprint of techniques, nor through the disinterested delivery of disciplinary knowledge" (Edwards and Blake, 2007, p. 38) is a critical one, there are still risks depending on how that enquiry is ideologically framed. From a rationalist perspective, teachers' enquiries into their own classrooms may be limited to the reasoned analysis of practice, where practice is measured against policy and research without enough engagement with the socio-political context of either. Without a critical approach to enquiry, that sees ideology and power as necessary dimensions to research and pedagogy, practitioner enquiry risks becoming a mechanism for teachers to legitimate their practices by narrowly aligning them to the established policies. "Good" findings may end up being used to exemplify the successes of policy, vindicating teachers and governments of inadequacy. The question this raises is whether or not teachers might feel that they are able to interpret the policy standards, or what counts as evidence for effective teaching and learning, in creative and critical ways.

According to Edwards and Blake (2007, p. 34), one mechanism for the regulation of teachers' identities "is the persistence in education of a belief in an objective, transcendent rationality, the assumption that there is a neutral vantage point from which student teachers, by submitting to the technology of reason and logic, may discern order, laws and clarity across teaching dilemmas within particular contexts." Where teachers are conceived of (and where they conceive themselves as) masters of disciplinary knowledge, performers of professional standards, and practitioners of reasoned enquiry, purely rationalist models of teacher identity formation become insufficient. This is not to say that teachers should not feel like powerful actors within their disciplines, or that their interrogation of their professional practices are not valuable, or that it does not lead to valuable learning. Instead, this is to say that a rationalist model provides only a partial view of what it means to be a teacher and do teaching (Aronson, 2020). In the next section, we outline the possibilities for emotional competency as part of a more holistic approach to understanding teacher identity formation.

Affective models of teacher identity

Who teachers are, their relationship to the content knowledge they teach, the contexts and institutions of learning within which they work, and the relationships they establish with staff and students matter (Aronson, 2020). Zembylas (2007) provides a useful conception of how an "emotional ecology" contributes to educational work in the classroom as well as teachers' identity formation. Defined as "a teacher's (or learner's) emotional knowledge in a particular social and political context, including rich connections to emotional experiences, and relationships with others (e.g. students, colleagues, parents) over time" (Zembylas, 2007, p. 357), the emotional ecology of a place of learning (from classrooms to whole school experiences) aid in enabling or disabling effective teaching and learning. Such an ecosystem is therefore also characterized by, at the very least, (1) issues of investment (Norton, 1995; Darvin and Norton, 2015), where teachers' relationships to content knowledge and pedagogical approaches influence the extent to which they are able to work productively and in culturally sustainable ways (Ladson-Billings, 2014), and (2) how teachers position themselves, taking up or resisting identities.

In the first instance, issues of investment in content knowledge and pedagogical approaches suggest that having knowledge of what to teach and how to teach is not enough. The emotional attachment that teachers have to their subject area, their profession, and how they understand the impact of their teaching on learners is paramount to whether or not teachers themselves might see their identities and practices as worthwhile. Here, "investment regards the learner [and the teacher] as a social being with a complex identity that changes across time and space and is reproduced in social interaction" (Darvin and Norton, 2015, p. 37). By recognizing whether or not, and to what extent, teacher's emotional investment in their work affects their practice, teachers themselves can begin to interrogate more deeply the socio-cultural and political agendas that underlie their practice. For instance, in a climate where assessment-driven teaching dominates, teachers who resist the culture of teaching-to-the-test may experience certain emotional tensions that "compel them to realign their pedagogical practices and beliefs" (Loh and Liew, 2016, p. 269) to the underlying neo-liberal ideology at work. In negotiating these tensions, teachers are required to evaluate their own beliefs and reasons for teaching while taking seriously the effects that their own practices may have on their learners. Teachers who take up critical approaches to teaching, then, will have their commitment to social justice education tested by institutions bent on achieving high attainment levels that are narrowly defined, colleagues who regard successful teaching as only that which results in learners' high attainment scores, or even learners who cannot see the connection between classroom content and their current or imagined lives.

The second component to an emotional ecology (Zembylas, 2007) is that of agency and the positions that teachers take up or resist in relation to professional identity. Related to investment, teachers' capacity to recognize, acknowledge, and confront their own subject positions (values, beliefs, performances) as they emerge in specific socio-cultural contexts enables teachers to understand how their own identities, practices, and emotional investments reproduce or challenge certain social norms. In this sense, teachers are *positioned* (Janks, 2010) by policy constructs of professional identity, institutional cultures of teaching and learning, and regulatory boards. They are also *positioning* (Janks, 2010) through the impact of their pedagogical choices in the classroom that enable or disable particular ideologies, their selection of content, and the relationships they help to establish with learners in the classroom that may validate or stigmatize certain learner-identities. For example, consider how student teachers in one South African teacher education program critically reflected on their own gendered identities in order to consider how their beliefs and

socio-cultural context positioned them in particular ways. Their engagement with identity exposed possibilities for how critically reflective work might be used to rethink their classroom practice in ways that might enable their imagined learners to think more critically about language and gender (Govender, 2019). In this study, the emotionally-laden reflective writing by student teachers revealed both the conceptual and emotional work involved in facing social issues such as gender and sexual diversity, and how this might be used by those student teachers to (re)position themselves (and each other) in more socially just ways.

Therefore, the “rich connections” (Zembylas, 2007) that teachers make with their learners and other teachers, across educational contexts and cultures, can be understood as intrinsically linked to their ways of identifying (being) and acting (doing) where “emotions are regulated socioculturally whereby members of discourse communities are taught which emotions are considered appropriate in particular social situations and which are viewed as improper” (Jaggar, 1988, cited in Benesch, 2018, p. 61). Understanding how emotional ecologies are constructed in the interests of some and used to police (student) teachers into particular ways of teaching, thinking, doing, and believing is therefore necessary in professional identity construction and development that takes on a social justice agenda (Aroson et al., 2020; Vasquez et al., 2019). Validating and negotiating the emotional ties and responses that teachers have to social issues, content knowledge, pedagogical approaches, and so on, in socio-cultural context may enable those teachers to take hold of their agency and construct identities and practices that are more culturally responsive, sustainable, and socially just.

An integrated approach

An integrated approach to understanding teacher identity and its development over space and time recognizes how reason and emotion, rationality and affectation, inform each other across socio-cultural context, individual and collective identities, and disciplines or communities of practice. It also advocates for the critical engagement of both self and socio-cultural context by pointing at the insufficiency of technical-rationalist approaches alone (Mockler, 2010). Table 1, below, attempts to map the rationalist, affective, and rationalist-affective crossovers evident in the literature on teacher identity.

From this outline, it becomes easy to see how the underpinning theoretical perspectives on teacher identity, and its development, influence what constitutes a “good” teacher, and by effect “good” teaching. This starting point therefore has a ripple effect on the ways in which disciplinary knowledge, professional standards, change, reflection and practitioner enquiry, and social context and power are perceived as either having or not having an effect on how teachers see themselves, their work, and their impact in and out of the classroom. For instance, cognitive approaches to disciplinary knowledge foreground knowledge over people while affective approaches position teachers as emotional beings who reflect on their emerging proficiency in disciplinary knowledge. At the crossover, a rationalist-affective model places teachers in the role of knowledge co-constructors. Here, alongside their learners, teachers can begin to negotiate what knowledge counts, how it is used, and the effect such knowledge has on their own identities as teachers as well as its effect on learners’ understanding of the world (Moje, 2008). Over and above reflecting on their emotions, teachers must also interrogate their investment (Darvin and Norton, 2015) in the field and its role in learners’ lives (that is, learners’ investments).

Rationalist-affective approaches, then, emerge from a tradition of poststructuralism in education. Identity, from this perspective, is fluid and continuously changes in relation to:

1. *Changing policies and professional standards.* At this level, policy constructs of professionalism are interpreted and critically evaluated in relation to teachers’ contexts of work as well as their own ideological or belief systems. What counts as “professional identity”, then, is constructed by the teacher in relation to external forces such as national professional standards, initial teacher education assessment criteria (Cochran-Smith, 2003; Cochran-Smith et al., 2020; Buchanan, 2014) and ethics (Lofthouse, 2014), and not the other way around.
2. *Developments in disciplinary knowledge.* As co-constructors of disciplinary knowledge and practitioners within disciplinary communities of practice, teachers should not only measure their technical proficiency of the discipline but also their investment in the discipline and the social effect of their approach to disciplinary knowledge on learners (Ellis and Smith, 2017). That is, are teachers merely socializing learners into existing communities of practice, or are teachers engaging learners in processes of knowledge construction in socially sustainable ways?
3. *Changing learner populations and contexts of teaching and learning.* Teachers do not work in a vacuum, and so how they perceive and engage with difference, diversity, and power is affected by their own subject positions. That is, teachers’ personal beliefs, dispositions, and emotions affect their pedagogies and educational approaches (Hinojosa Pareja and López López, 2018). Critically reflective teachers (Govender, 2019; Kubanyiova, 2020; Aronson, 2020), then, actively interrogate how their own subject positions affect their pedagogical decisions and change over time with changing educational contexts.
4. *Reflective practice and practitioner enquiry that foregrounds teachers’ agency.* Reflection and practitioner enquiry practices are processes for engaging with teacher identity, and necessarily crosses the boundaries of what teachers do in schools and the effects of these actions (Lassonde and Israel, 2008). However, it is also important to make clear how these actions are imbued with ideologies, and therefore how an investigation into those actions constitutes a “critical inquiry” (Cochran-Smith et al., 2020).
5. *How teachers view themselves in relation to issues of power in and out of the education system.* Because teaching involves both ways of doing and being (Vasquez et al., 2019), teachers’ identities are intrinsically bound to issues of power. Race/ethnicity, gender, sexuality, nationality, age, (dis)ability, and so on, all contribute to how professionalism and educational practice happen (Lawrence and Nagashima, 2020). Rationalist-affective models of teacher identity, then, actively engage with these issues in context and in relation to their social impact on learners and learning environments by taking specifically socio-cultural and poststructuralist perspectives.

Table 1 Mapping the rationalist, affective and rationalist-affective crossovers in teacher identity.

	<i>Rationalist models</i>	<i>Affective models</i>	<i>Rationalist-affective crossovers</i>
Theoretical perspective	Teacher identity development is conceptualized from cognitivist perspectives	Teacher identity development is conceptualized as emotional and/or pastoral	Teacher identity development is conceptualized from socio-cultural and poststructuralist perspectives
Disciplinary and pedagogical knowledge	Teachers as experts of disciplinary and pedagogical knowledge define their identity in relation to the mastery of knowledge and practice	Teachers' investment (Darvin and Norton, 2015; Norton Pierce, 1995) in disciplinary and pedagogical knowledge and practice is foregrounded	Teachers are constructed as co-constructors of disciplinary and pedagogical knowledge and practice, which is influenced by both their (perceived) mastery and investment in the field
Professional standards	Professional standards provided by national and international policy construct teacher identity development as the learning and performance of pre-defined, measurable, competencies and skills	Navigating the emotional ecology (Zembylas, 2003, 2007) of one's personal and professional contexts is necessary in unpacking and constructing changing teacher identity	Professional standards are interrogated in relation to the socio-cultural contexts they are meant to represent, while the performance and evidencing of professional standards are interrogated in relation to identity, the context of performance, ethics, and power
Change	Teacher identity is perceived as developmental and measurable, as described in professional standards and initial teacher education assessment criteria	Teacher identity is perceived as developmental and measurable, as described in professional standards and initial teacher education assessment criteria, but it also involves taking seriously the emotional impact of teaching on teachers and learners	Teacher identity is envisaged as a fluid construct that changes with contexts of teaching and learning, foregrounding teachers' ongoing negotiation of knowledge, practice, investment, institutional culture, and so on.
Reflection and practitioner enquiry	A professional standards-based approach focuses on teachers' identity as primarily connected to their performance of established criteria	Teacher-reflection is advocated as a means to identify and unpack how teachers, their feelings, and the impact of their teaching, influence teacher identity development	Critical reflection and critical approaches to practitioner enquiry recognize that teachers, as emerging and agentive participants in communities of practice (Lave and Wenger, 1991), must negotiate not only professional standards and initial teacher education assessment criteria but also their own ideological positions (including ways of doing, thinking, being, reading, writing, speaking, believing)
Social context, ideology and power	Teacher identity is situated in the mind and is measurable in relation to skills competency	Teacher identity is constructed in relation to their contexts of teaching (such as learners' needs and the labels used to describe their contexts in relation to socio-economic status, deprivation or privilege, resources, and so on)	Teachers' identities inform and are informed by their contexts of work and life (including under systemic relations of power related to socio-economic equity, race/ethnicity, gender, sexuality, age, region, language, and so on)

Teacher identity, then, and its development involve ongoing, critical negotiations of who teachers are, who they want to be, the effects they have on their learners and social context, and the ways in which they navigate the plethora of ideologies already embedded in everyday educational practice. This is all done in view of the external and internal forces that teachers negotiate on a day-to-day basis.

Conclusion

This article has explored the politics of teacher identity, and its development, in the research available. By paying particular attention to the role of rationalist-technical and affective models, it becomes clear how important it is that emerging teachers and teacher education are able to critically engage both rationalist and affective approaches to professional identity. This is doubly important when one considers the extent to which identity and socio-cultural context can shape the lived experiences and practices of teachers and their learners.

From the literature reviewed in this article, six domains that shape, and are shaped by, teacher identity and identity development have emerged: (1) theoretical perspective, (2) disciplinary and pedagogical knowledge, (3) professional standards, (4) change, (5)

reflection and practitioner enquiry, and (6) social context, ideology, and power. Each of these domains, as discussed, are interdependent and bound to particular contexts, communities, and cultures. Interrogating them, then, becomes vital in understanding how teachers understand themselves and themselves within and without the teaching profession and in relation to society, culture, ideology, policy, and investment. This has implications for transforming classroom practice and teacher education into becoming more sustainable, inclusive, and socially just.

Recent research has suggested that a move toward integrated, rationalist-affective border-crossing perspectives on teacher identity and teacher identity development have been taken up in teacher education programmes, especially where this relates to socio-cultural models of literacy and literacy education (Burgess and Rowsell, 2020; Johnson and Golombek, 2020; Gupta, 2020; Aronson et al., 2020; Lawrence and Nagashima, 2020; Hong and Cross Francis, 2020; Kocabaş-Gedik and Ortaçtepe Hart, 2020; as well as others). This, it would seem, speaks back to dominant neoliberal moves (Winter, 2000; Edwards and Blake, 2007) in educational policy across global contexts and advocates for the recognition of (student) teachers' diverse contexts and cultural identities as resources for educational practice – especially where they have a direct impact on the lives and education of children and young people. Furthermore, such recognition may enable increased teacher agency and renewed understandings of professionalism: from ongoing self-reflection and practice-based inquiry that is socially and culturally situated, to the construction of socially and culturally sustainable curriculums that engage both intellectual and emotional faculties. This may also have implications for research and research practices that engage more fully with the needs of particular contexts and peoples in relation to education (O'Keeffe and Skerrett, 2021; Medina, 2020).

While the current research paints a promising picture for teachers and teacher education, work needs to continue and systemic changes need to be made. By actively engaging in rationalist-affective crossovers, teachers, teacher educators, and the students who are meant to benefit most from education might be able to spot the issues in the system, pose critical questions, research and problem solve, and effect change on their circumstances and environments in sustainable ways.

Introduction

Over the past fifty years, teacher educators in the United States have come to acknowledge the diversity among K-12 student populations, as well as the need to take that diversity into account in both K-12 teaching and teacher education in order to achieve educational equity and broader social justice for all students and their communities. Unfortunately, efforts to address these realities through teacher education, when taken as a whole, have ranged from minimally effective to actively harmful. In this article we briefly examine efforts by teacher educators in the US to address student diversity, educational equity, and social justice with the goal of drawing lessons that may be of value globally. We begin by considering what teacher educators mean by “student diversity,” then review and critique the primary methods teacher educators have developed to attempt to prepare teachers who can work with and for a diverse student population to achieve educational equity and social justice. We end by considering the common features of the challenges and failures of these approaches to teacher education, and suggest a transformative teacher education framework as a key to surmounting these challenges by synthesizing Critical Race Theory as the roadmap, culturally relevant and sustaining community-based teacher education as the vehicle, and critical reflection for transformative learning as the engine.

Student diversity

A review of literature on education reform in the US shows that the 1969 Othaniel Smith Report, *Teachers for the Real World*, is one of the earliest recognitions of student diversity, although the word “diversity” does not appear in that work. Rather, Smith wrote of “disadvantaged youth,” a term that moved from a sociological association with poverty to encompass other kinds of disadvantage in the 1960s. According to Smith, disadvantaged youth are: (1) denied choice in careers; (2) denied any semblance of political power and even denied the opportunity to learn democratic decision making; (3) stigmatized as culturally disadvantaged, excluded from the broader cultural activities, and have their own culture denigrated; (4) denied inter- and intra-personal competence, segregated from the larger society, and labeled as socially or emotionally disturbed if they protest against the inequity of the situation (pp. 3–4). Smith’s definition did not specify groups that could be labeled “disadvantaged,” instead focusing on the social costs they face by being so labeled. More recent notions of diversity tend to focus on a list of the ways in which groups diverge from a norm that itself remains undefined. For example, Zeichner (1996) lists social class, ethnicity, race, and language (p. 133). Banks and Banks (2010) list gender, social class, ethnic, racial, or cultural characteristics (p. 3). The National Council for Accreditation of Teacher Education (NCATE, 2006) defines “diversity” as “differences among groups of people and individuals based on ethnicity, race, socioeconomic status, gender, exceptionalities, language, religion, sexual orientation, and geographical area” (NCATE, 2006).

For the purposes of this article, we define diversity in terms of the spectrum of educational disadvantage articulated by Smith (1969), understanding that the basis for this spectrum, while reflecting global factors that produce some commonality from place to place (colonialism, neo-liberal political economy, White supremacy, and so forth) is primarily determined by regional and local socio-political realities. The primary examples in this article are drawn from the US which, primarily constructs the spectrum of disadvantage in terms of race, gender, and language.

According to statistics kept by the National Center for Education Statistics, the US K-12 public school student population continues to become more diverse. White students represented 88% of the school population in 1972, but as of 2020 have become a minority, representing 46% of the total public student population. This number is expected to drop to 43% by 2030. Significantly, Hispanic students represented 28% of the total public student population, followed by Black student (15%) and Asian students (5%) (NCES, 2022a). At the same time, the nation's teaching force remains primarily White. In 2017–2018, 79% of America's teachers were White (NCES, 2022b). Hispanic teachers represent only 9% of the teacher workforce, followed by Black teachers (7%) and Asian teachers (2%) (NCES, 2022b). Similarly, the number of students labeled as English learners (ELs) or speakers of non-standard variants of English is significant and growing. In fall 2019, the percentage of US public school students who were English learners (ELs) was 10.4% (5.1 million students), higher than in fall 2010 (9.2%, or 4.5 million students). In some states such as Texas and California, students who were ELs were approaching 20%.

In spite of data clearly showing that the growth in diversity has emphasized race, ethnicity, and linguistic diversity, research indicates that teachers tend to avoid using race and ethnicity in their conception of diversity, preferring socially safer terms such as “culture” (Ladson-Billings, 2009). Moreover, teachers' ideas of culture tend to be “reductive,” essentializing minoritized groups through stereotyping (Howard, 2013, p. 2001) in a way that reinforces a “deficit model” (Valencia, 2010) that lays the blame for educational inequities on the students, their families, and their communities instead of on schooling and the larger society. It is likely that these tendencies are also found in other countries that use other criteria to minoritize portions of their population—avoiding key criteria used to disadvantage students in favor of a focus on broad generalities, and constructing deficit views of those minoritized students, families, and communities. Teacher educators in the US, seeing these problems, have worked to combat these tendencies, albeit with limited success, by preparing new teachers with the tools to recognize the habits of mind and patterns of acting that systematically disadvantage minoritized students, families, and communities (Liu and Ball, 2019). On the belief that understanding the challenges, successes, and failures of US teacher educators' efforts might be instructive for teacher educators in other countries, we now examine attempts to prepare future teachers to teach a diversity of students.

Preparing future teachers to teach diverse students

In the US, there have been two common approaches to teacher education for equity and social justice across diverse communities: (1) educating prospective teachers from dominant groups to work with and for minoritized communities, and (2) recruiting, preparing, and retaining prospective teachers from minoritized groups to work with and for their communities (Ball et al., 2021, Liu, 2017; Liu and Ball, 2019; Gist, 2017; Gist et al., 2014; Ingersoll and May 2011, 2016; Kohli, 2019; Philip, 2013; Sleeter, 2008). Because the key elements of diversity in the US are race, ethnicity, and linguistic diversity, these two approaches are typically described as “preparing White teachers for diverse students” and “recruiting, preparing, and retaining teachers of color.”

Preparing white Teachers for diverse students

In the US, there are three major approaches to preparing White teachers for diverse students, the trajectory of which may be instructive in other parts of the world in which the dominant and minoritized populations are structured along lines other than race and ethnicity: Multicultural Education, Culturally Responsive Pedagogy, and Culturally Sustaining Pedagogy.

Multicultural education

Multicultural education arose more or less simultaneously in the 1970s in the US, the UK, and Australia (Banks, 1974; Grant, 1975; Gay, 1977; Bullivant, 1972) in response to a general concern that K-12 education was too narrowly focused on White middle-class suburban norms and experiences, and therefore students in minoritized groups were not being equitably educated. The core idea is to bring a diverse range of experiences into the classroom in order to better include minoritized students while addressing fundamental ignorance about minoritized groups endemic among students (and teachers) in the dominant group. Several broad literature reviews by Sleeter and Grant (1987) and Bennett (2001) demonstrate the enormous scope of research and pedagogy generated over several decades under the rubric of multicultural education—they do not, however address teacher preparation. They do demonstrate that, in spite of the use of the word “culture,” in the beginning multicultural education was more closely linked with notions of race, ethnicity, and linguistic diversity, and had a somewhat contentious relationship with the identity politics of gender, sexual orientation, and disability. As early as 1974, Banks warned against the expansion of multicultural education beyond race and ethnicity, arguing that race and ethnicity are so fundamental to American inequity that they must be addressed first, and that bringing in other ways people identify in groups would harm the causes of both sides (Banks, 1974). A year later, Grant warned that instrumentalizing multicultural education as a set of skills transmissible through professional development would not address the elimination of race-based inequities built into the American school system (Grant, 1975).

Notwithstanding early warnings by Banks and Grant, and repetitions over the years (see Milner, 2017), the focus of multicultural education in both practice and research has shifted away from race and ethnicity as it has become a standard pedagogical subject in US teacher education programs. As a result, the majority of teacher education programs—and the majority of research on multicultural teacher education—focuses on the efficacy of teaching White teachers to teach “students of diversity” by changing their mindset through some combination of self-reflection and exposure to students of color. How to accomplish this has remained unclear; Banks has long advocated teaching “multiple dimensions” of multicultural education in his influential textbook (Banks, 1995),

whereas Sleeter argued two decades later for targeting specific resistant practices of White preservice teachers, focusing their learning about multicultural education on understanding interest convergence, color blindness, and experiential knowledge—concepts drawn from Critical Race Theory (Sleeter, 2017).

Regardless of the specific conception of multicultural education, recent examples of coursework in the literature still emphasize self-reflection and/or exposure to students of color. For example, Davis (2009) used “critical consultation” between White preservice teachers and students of color in their placements to encourage preservice teachers to discard their habitual deficit thinking. Souto-Manning (2010) built a course using theatrical role-playing methods to raise the awareness of racism among White preservice teachers, and Matias and Mackay (2016) constructed a course focused on self-reflection to try to accomplish the same ends. Several scholars advocate autobiography or other narrative inquiry methods to encourage self-reflection around multicultural issues (Fits Fulmer, 2012; Rieger, 2015). In many teacher education programs, as Grant and Koskela (1986), Zeichner (1993), and others have observed, multicultural teacher education tends to be handled with a single course (or inservice workshop) rather than being integrated into the entire teacher education curriculum. Given the centrality of self-reflection and exposure to students of color to these multicultural teacher education programs, it is reasonable to predict that this “one-shot approach” (Zeichner, 1993) would have limited effectiveness—and, indeed, several scholars (Amos, 2010; Evans-Winters and Hoff, 2011; Philip and Benin, 2014) suggest that, far from infusing White teachers with a sense of social justice, isolating multicultural content from the rest of the curriculum reinforces unexamined assumptions about race and ethnicity.

Parallel to the multicultural education courses in teacher education programs, research since the 1990s on the efficacy of such courses has focused on assessing changes in White teachers’ attitudes toward students of colors (see, for example, Gomez, 1994; Goodwin, 1994; Deering and Stanutz, 1995). This research relies primarily on the self-reports of White teachers, with researchers interpreting statements made by teachers in surveys, interviews, and professional portfolios. For example, Horton and Scott (2004) employed Freire’s generative themes to examine the responses of four White preservice teachers to a multicultural education program, locating each participant in one of the stages of racial identity development suggested by Helms (1990). They found that, far from encouraging notions of pluralism, short-term multicultural education courses seemed to stimulate even more rigid notions of White identity. Amos (2010), working with a framework of Critical Whiteness theory, observed similar behavior, and went so far as to title his article “They Don’t Want To Get it!” using a quote from one of the preservice teachers of color about their White classmates to summarize the problem: White preservice teachers dominate discussion in multicultural education classes, in part because the structures of teacher education encourage such dominance (Rieger, 2015).

In sum, it appears that consciousness raising through dedicated coursework and exposure to students of color has not produced the desired transformation of White teachers that early multicultural education theorists once envisioned. Moreover, even when White teachers claim transformation, their actual classroom behavior has not been examined systematically.

Culturally relevant pedagogy

Students of color and their families have been historically viewed through deficit approaches, their language, literacies, and cultures considered deficiencies requiring replacement with schooling “standards” embodying the language, literacy, and cultural practices of the dominant majority (Leonardo, 2004; Paris and Ball, 2009). The result in the US is a “grammar to normalize the standards of white supremacy as the standard for all sorts of everyday transactions” (Bonilla-Silva, 2012, p. 1) that determine what to teach, how to teach it, and how to assess student learning. The learning outcomes of students of color based on this curriculum and pedagogy are then used as evidence to further support a deficit framework and justify their exclusion from learning opportunities in areas such as STEM (Riegle-Crumb et al., 2019). Problems such as these stimulated concerns that multicultural education placed too much emphasis on fitting students of color into the standards of Whiteness, which hindered the ability of students of color to achieve to their academic potential. In response to this concern, Gloria Ladson-Billings penned a seminal article “Toward a Theory of Culturally Relevant Pedagogy” (1995), drawing from the practices of successful teachers of African American students to develop a coherent theoretical and pedagogical foundation for academic achievement. This *culturally relevant pedagogy* attempted to make teaching and learning relevant and responsive to the languages, literacies, and cultural practices of students of color to “produce students who can achieve academically ... who demonstrate cultural competence, and ... who can both understand and critique the existing social order” (p. 474). Culturally relevant pedagogy also calls for students to develop critical perspectives that challenge societal inequalities. Since Ladson-Billings called for culturally relevant pedagogy the approach has been elaborated via a range of frameworks (Brown-Jeffy and Cooper, 2011) and textbooks (Ladson-Billings and Paris, 2021) into an important element of many teacher education programs.

Culturally sustaining pedagogy

Culturally relevant pedagogy was a step forward in reducing the deficit view of students of color, and bringing their life experiences into multicultural education as an active element in teaching and learning. However, as happened earlier to multicultural education, over time culturally responsive pedagogy as implemented in teacher education programs failed to live up to its promise. Ladson-Billings observed this firsthand in teacher education, noting that many practitioners, and those who claim to translate research to practice, seem stuck in very limited and superficial notions of culture Even when people have demonstrated a more expansive knowledge of culture, few have taken up the sociopolitical dimensions of the work, instead dulling its critical edge or omitting it altogether.” (Ladson-Billings, 2014, p. 77).

The result was “teachers who had good intentions toward the students and wanted to embrace culturally relevant pedagogy” but who “rarely pushed students to consider critical perspectives on policies and practices that may have direct impact on their lives and

communities” (Ladson-Billings, 2014, pp. 77–78). In other words, culturally relevant pedagogy had become another simplistically applied classroom technique, accepted in theory by preservice and inservice teachers, but not implemented in practice.

At about the same time, and seeing many of the same issues with both multicultural education and culturally relevant pedagogy as practiced in teacher education as well as K-12 education, Django Paris (2012) argued that educators should not just work to help minoritized students adapt to the culture of the dominant majority, but should also “ensure the valuing and maintenance of our increasingly multiethnic and multilingual society” (p. 94). He therefore suggested the idea of *culturally sustaining pedagogy*, which focuses on supporting the learning of students of color in their home languages and cultures as the base for academic achievement in both the dominant and minoritized cultures. In terms of teacher education, culturally sustaining pedagogy attempts to

offer pre-service and in-service teachers a way of both naming and conceptualizing the need to meaningfully value and maintain the practices of their students in the process of extending their students’ repertoires of practice to include dominant language, literacies, and other cultural practices [it] seeks to perpetuate and foster—to sustain—linguistic, literate, and cultural pluralism as part of the democratic project of schooling. (p. 94).

Paris has continued to elaborate culturally sustaining pedagogy both individually (Paris, 2021) and in collaboration with H. Samy Alim (Paris and Alim, 2017) the approach has been applied by other educators and has informed an effort to revitalize culturally responsive teaching (Ladson-Billings, 2014).

Recruiting, preparing, and retaining teachers of color to teach diverse learners

The approaches to preparing teachers for a diverse student population described above were all developed under the reality that the majority of K-12 teachers in the US are White; indeed, the current teaching force, although slightly more diverse than in past years, still remains about 79% White (NCES, 2022b). However, efforts have been made to recruit, prepare, and retain teachers of color—an approach that seeks to change the makeup of the teacher corps, and not accept the overwhelming Whiteness of education as natural. Villegas and Irvine (2010) identified three research-based rationales for increasing the supply of teachers of color: (1) teachers of color serve as role models for all students; (2) teachers of color can improve the academic outcomes and school experiences of students of color; and (3) more teachers of color are needed to reduce the acute shortage of educators for high-needs urban schools (pp. 176–186). Research shows that teachers of color in the US can benefit all students, providing caring, decriminalizing and humanizing education to students of color historically subjected to intergenerational legacies of violence and punishment often leading to incarceration (Basile, 2021; Bryan, 2020, 2021; Siddle Walker, 2001). Moreover, recruiting, preparing, and retaining teachers of color can lessen the multigenerational socialization of White oppression over students of color passed down from White teachers to White students (Bryan, 2021). Further, Villegas and Irvine (2010) found that teachers of color have more favorable views of students of color, as well as greater recognition of their academic potential.

For these reasons, efforts have been made over several decades to recruit, prepare, and retain teachers of color. For example, Villegas et al. (2012) summarized four specific recruitment strategies promoted by the Education Commission of the States (1990) to recruit teachers of color which are still employed today: (1) early recruitment and college entrance support programs targeting promising pre-college students; (2) partnerships between two- and four-year colleges to facilitate the transition of community colleges students into four-year colleges; (3) career ladder programs for paraprofessionals; and (4) financial incentives such as scholarships, forgivable loans, and signing bonuses. Literature indicates that teacher education programs have adopted all of these strategies in the past two decades to recruit prospective teachers of color (see Gist, 2014; Schultz et al., 2011; Toshalis, 2012; Valenzuela, 2017; Villegas and Davis, 2008). Once recruited into teacher education programs, preservice teachers of color are faced with curricula, instructional strategies, and fieldwork constructed in the context of the White, middle-class preservice teachers (Cochran-Smith et al., 2015) who form the bulk of their fellow students and their teacher educators. As a result, teacher education programs tend to make few concessions to the life experiences, cultures, and languages of prospective teachers of color (Gist, 2014, 2017; Kohli, 2019), nor do they address the specific needs of prospective teachers of color in themselves learning to teach a diverse student population (Brown, 2014; Liu, 2020). Instead, the programs have primarily focused retention efforts on providing academic support through tutoring, learning communities, and exam preparation workshops, and in some institutions they social support by identifying cohorts of students of color on which to base cultural events, counseling, and advisement (Gist, 2014) including peer and near-peer mentorship programs (Berry et al., 2008; Carver-Thomas, 2018).

A review of the literature on the recruitment, preparation, and retention of prospective teachers of color primarily reveals that most research focuses on two areas: (1) experiences of prospective teachers of color in teacher education programs; and (2) how teacher educators support prospective teachers to develop awareness of their identity, cultural and linguistic assets, and/or their bias and limitations. The first area focuses on the cultural and social isolation (Ladson-Billings, 2001; Schultz et al., 2008), institutional racism (Gay, 2005; Irizarry, 2007; Villegas and Davis, 2008; Woodson and Pabon, 2016), and ideological and curricular challenges (Milner, 2008; Philip, 2010) that prospective teachers of color experience in teacher education programs. Ladson-Billings (2001), for example, documented the experience of a prospective teacher of color who considered dropping out due to the lack of diversity in the program, remaining only after two other prospective teachers of color joined the program and they were able to support each other in their study. Irizarry (2007) and Kohli (2014) also documented how prospective teachers of color endured institutional racism such as overtly racist comments or actions and racial hierarchies. Similarly, Kohli (2019) studied 11 women

teachers of color about their teacher preparation experiences, finding that they believed their teacher preparation programs not only marginalized them during their preparation, but continued to negatively affect their careers as they entered the field with limited tools to resist racialized institutional structures and practices (p. 10). Gist (2017) exploring the program and pedagogical experiences of teacher candidates of color, found that prospective teachers experience a lack of culturally and linguistically responsive learning in their teacher education programs. In parallel findings, Philip (2013) documented the experience of a prospective teacher of color who entered the teacher education program with a strong commitment to equity and social justice, but found that the strengths gained through college student activism were overlooked and the teacher education program failed to help her understand the nuances, strengths, and limitations of her activist stances within the context of classroom teaching and institutional change within schools.

The second area of research on prospective teachers of color focuses on how teacher educators facilitate prospective teachers of color in developing a deeper understanding of who they are, where they are situated in society, what assets they have, and what biases they bring to education. This has been addressed through critical reflection and collaborative dialogue (Clark and Flores, 2001; DePalma, 2008; Kohli, 2012, 2014; Tellez, 1999). Villegas and Davis (2008) argued that teacher educators need to create a safe space conducive to critical dialogue in the preparation of prospective teachers of color. Similarly, Clark and Flores (2001) focused on how providing pedagogical approaches can support the ethnic identity development of Latinx teacher candidates to increase confidence in their ability to enact culturally responsive pedagogy. Kohli (2014), as well, found that prospective teachers of color felt that critical dialogue on internalized racism within teacher preparation was essential to developing pedagogy that challenged racial inequality. These approaches provide valuable pedagogical guidance for teacher educators regarding how to recognize and cultivate the cultural and linguistic strengths of prospective teachers of color.

Addressing the roots of inequity through transformative action

Considering together the two approaches to preparing teachers for a diverse student population—working to improve the practice and disposition of White teachers and preparing teachers of color—there appear to be clear limits to what either approach can accomplish. Multiple studies (Evans-Winters and Hoff, 2011; Horton and Scott, 2004; Matias and Mackey, 2016; DePalma, 2008) indicate that the habits of privilege on the part of White preservice teachers and the general structures and assumptions of Whiteness in teacher education programs combine to amplify the voices and biases of White preservice teachers and teacher educators and silence those of preservice teachers and faculty of color, reducing or eliminating elements of critique in favor of symbolic incorporation stereotyped notions of “culture.” Moreover, programmatic efforts to recruit and retain prospective teachers of color give little attention to preparing them to teach students of color, assuming that their non-White identity is sufficient to enable classroom success. Thus, although the practice of recruiting more students of color to teacher education programs has, to certain extent, diversified the K-12 teaching force, without further changes to teacher education curriculum, pedagogy, and instruction, is unlikely to produce significant transformation of schooling in the US.

A review of the literature on preparing teachers for a diverse student body indicates three fundamental problems, all stemming from a loss of emphasis on the deep roots of inequity in schooling, and a concomitant lack of focus on transformative action by teachers. First is the fundamental problem of Whiteness in teacher education. Prospective teachers of color need support to navigate the racialized teacher education programs and critique the dominant social order. If teacher educators wish to teach prospective teachers to implement culturally relevant and sustaining pedagogy in their future teaching, they should implement culturally relevant and sustaining pedagogy throughout the programs, building curriculum and field experience on prospective teachers of color’s cultural capital (Yosso, 2005) or funds of knowledge (Moll et al., 1992). In addition, once students of color become teacher education candidates, their programs are often predominantly White (Ladson-Billings, 1995) with curriculum, pedagogy, methods, and field experiences constructed to prepare White teachers, and thus fail to provide the types of social, cultural, emotional, and academic support that students of color need to successfully complete the program (Bryan, 2021; Gist, 2014; Sleeter and Thao, 2007). Prospective teachers of color then encounter marginalization and discrimination in teacher education programs similar to their experiences in the K-12 system (Liu, 2020; Burant, 1999; Parker and Hood, 1995; Sleeter, 2001).

Second is the problem of interest convergence. Although research shows that exposure to diverse students and communities dramatically improves the ability of White prospective teachers to empathize with students of color and implement culturally responsive teaching (Milner, 2006), scholars have also repeatedly observed that race rarely has a central place in American teacher education (Milner, 2003, 2017; Milner and Laughter, 2015).

The third problem is the lack of attention to how preservice teachers implement actions to support diverse learners in their classroom practice (Anderson and Stillman, 2013; Cochran-Smith et al., 2015). By *practice*, we mean “teacher candidates learning how to do the actual tasks of teaching” (Cochran-Smith et al., 2015, p. 117). However, much research that claims to study how teacher preparation influences prospective teachers’ professional practice does not investigate their actions in classroom contexts because practice is considered “teacher candidates being engaged as reflective and inquiring professionals” (Cochran-Smith et al., 2015, p. 117). This type of research has primarily engaged prospective teachers in talking about, analyzing, or reflecting on their teaching, and thus research data on practice is primarily based on prospective teachers’ reflections, self-reports, surveys, and interviews. Based on a thorough review of research on the preparation of teachers for urban and high-needs contexts, Anderson and Stillman (2013) find a disproportionate emphasis on belief and attitude change among prospective teachers with relatively little evidence for the development or change in actual teaching practice. They also find a tendency toward reductive views of culture and context.

Cochran-Smith et al. (2015) argued that “we need more research that goes beyond assuming that changing teacher candidates’ beliefs necessarily leads to different behaviors and actions in their classrooms” (p. 117). Thus teacher educators need to move beyond research on prospective teachers’ attitudes and perspectives about teaching diverse students to research on how they teach, what they teach, and how their teaching impacts the learning of diverse learners based on their day to day practices. This type of classroom practice-based research is time consuming and needs to deliberately take time into consideration in research design in order to see prospective teachers’ growth and transformation. It is, however, vital for the life and learning of marginalized learners, whose school experiences should be taken seriously and be used as first-hand data for teacher educators to transform their curriculum, pedagogy, and instruction.

Transformative Teacher Education for Educational Equity

In order to address the limitations of current approaches to teacher education for diverse student populations, we suggest a comprehensive reimagination of teacher education starting from the theoretical orientation through the institutional structures and practices down to the preparation of the individual preservice teacher. We envision this reimagination as a set of nested practices, each of which performs a different function while supporting the functioning of the other practices, much like physical road travel requires a roadmap, a vehicle, and an engine (Fig. 1). Here, however, the destination is not a physical one but a social and political one: transformation of the educational system to effect educational equity for diverse students.

The roadmap for transformation: Critical Race Theory

Critical Race Theory of education should be integrated into teacher education programs as an overarching framework to help preservice teachers understand race as the central construct to analyze school inequity, deciphering “the social-structural and cultural significance of race in education” (Ladson-Billings and Tate, 1995, p. 50). Ladson-Billings and Tate (1995) argued that although gender and class intersect with race, explanations based on class and gender differences are not powerful enough to explain all the difference in school experience and performance, including but not limited to higher dropouts, higher rates of out-of-school discipline, and failure of Black and Brown students. Critical Race Theory reveals that schools are designed to protect White economic interests through disparate educational opportunities (Ladson-Billings and Tate, 1995).

Critical Race Theory, in contrast to Multicultural Education, prioritizes the experience of minoritized communities of color over that of White teachers, even in the branches of Critical Race Theory that are specifically concerned with the concepts and mechanisms of Whiteness (such as Critical Whiteness Theory). From the standpoint of Critical Race Theory, educational institutions and practices function to perpetuate White supremacy, so the goal of teacher education should be to enable prospective teachers to recognize, acknowledge, and change those institutions and practices. This can be achieved by using history and lived experiences as counternarratives (Miller et al., 2020) to support prospective teachers in analyzing historical practices of slavery and the appropriation of the bodies and labor of enslaved people, the annexing of the indigenous land and genocide of the original inhabitants, the dehumanizing of immigrants, the segregation and resegregation of students of color, and also current unjust practices such as defunding schools in communities of color and overdisciplining students of color to push them into the carceral system.

Fig. 1 Transformative teacher education for educational equity.

The vehicle for transformation: culturally relevant and sustaining community-based teacher education

Critical Race Theory, with its emphasis on the ubiquity (and hence centrality) of the lived experience of racism, and its reliance on counter-narrative as both a source of knowledge and a mechanism for critique, should be placed at the center of *community-based teacher education* that deploys culturally relevant and sustaining pedagogy (Ladson-Billings, 2014; Ladson-Billing and Paris, 2021; Paris, 2012) in deep collaboration with local communities of color. All of the approaches to preparing White teachers for diverse student populations discussed so far assume a “traditional,” university-based teacher education model. However, there are approaches to preparing teachers for diverse students that do not assume a university-centric teacher education program, drawing from ideas of Community-Based Learning in an effort to address the needs of communities of color (Ball, 1995; Graue, 2005; Graue and Brown, 2003). As Graue (2005) observes, “there are significant discrepancies in perceptions between school people and parents about school efforts and family involvement in education” (p. 158), further exacerbated by racial and cultural differences between poor parents of color and the largely White middle class teacher corps (Bryk and Schneider, 2002; Meier, 2002; Noguera, 2001; Tschannen-Moran, 2004). Baquedano-López et al. (2013) revealed in their historical analysis that current education reform and practice on parent involvement has been dominated by a discourse incorporating White middle-class values, seeing parents from minoritized communities as problems in need of remedy. This deficit view fails to address the experiences of many parents and students from nondominant backgrounds through intersectional lenses of race, class, and immigration, evaluating nondominant families to abide by White, middle-class values and expectations. When nondominant families do not meet these expectations, educators consider them uninterested in their children’s education and thus blamed them for the school’s failure in educating their children (Ishimaru et al., 2019).

Zeichner et al. (2016) suggested that addressing these problems requires that teachers know about the communities in which their students grow, develop respectful and trusting relations with students’ families and other adults in their communities, and make use of this knowledge and these relationships to support their students’ learning (p. 277). Murrell (2000) calls this type of teacher a “community teacher” who

develops the contextualized knowledge of culture, community, and identity of children and their families as the core of their teaching practice. Community teachers possess the “multicultural competence” they need for accomplished practice in the communities they teach. Community teachers are individuals who typically live and work in the same under resourced urban neighborhoods and communities where students from diverse backgrounds live and go to school (p. 340).

In order to implement community-based teacher education, Baquedano-Lopez et al. (2013) argued that teachers need a paradigm shift from seeing parents as a deficit to parents having agency to advocate for their children and resist inequity, a type of teacher-family-community collaboration that Zeichner et al. (2016) termed as “teacher-family-community solidarity” (p. 278). Solidarity-oriented community-based teacher education has been implemented through community panels involving parents, community leaders as panelists (Zeichner et al., 2016), engaging community members as mentors for prospective teachers (Guillen and Zeichner, 2018; Zeichner et al., 2016; Zygmunt et al., 2018), and facilitating community and teacher educators in co-constructing teacher education programs (Ball et al., 2021; Fickel et al., 2018; Zeichner et al., 2016). These approaches represent a more democratic and transformative framework of teacher education, decentering the power of teacher educators and deconstructing the traditional White curriculum of teacher education programs by integrating the cultures, experiences, and practices of the communities of color.

Restructuring teacher education from the standpoint of Community-Based Learning is predicated on the belief “in the educability of all students, thus providing students from different social backgrounds, with diverse levels of ability and behavioral dispositions, opportunities to learn together to live together” (Lopez et al., 2012, p. 23). Aiming toward social justice and equity for marginalized students and communities, community-based teacher education on the one hand has proved effective in preparing White preservice teachers to teach in diverse communities (Guillen and Zeichner, 2018; Zeichner et al., 2016; Zygmunt et al., 2016; Zygmunt et al., 2018) and on the other hand, has the potential to encourage teacher education programs to actively recruit, prepare and retain teachers of color from and for marginalized communities. The combination, then, of community-based teacher education informed by Critical Race Theory and employing culturally relevant and sustaining pedagogy holds promise to dismantle the institutional and societal attitudes and practices of deficit thinking and a savior mentality toward marginalized students and communities.

The engine for transformation: critical reflection and generative change for transformative action

As critiqued earlier, there is a lack of attention to prospective teachers’ classroom actions; rather, teacher education practice and research tend to focus on changing prospective teachers’ attitudes and perceptions based on their self-reported evidence. In order to support prospective teachers to bridge reflection with action and develop from changed attitudes and perceptions to transformed action, we argue here that critical reflection for transformative learning and generative change are the ideal engine for community-based teacher education. Critical reflection is a hermeneutic approach to individual learning going back at least to Donald Schön (1983), if not John Dewey (1933), and is typically considered to involve repeated reexamination of one’s assumptions about knowledge and understanding, particularly those that are socially, politically, or culturally based. However, as Ball (2012) insisted

Fig. 2 The hermeneutic cycle of critical reflection for transformative learning. Adapted from Liu (2015, p. 148).

in her AERA Presidential Address, knowing is not enough: There must be a movement from thinking to action, from critique to intervention. For example, Brookfield argued (1995) that “reflection in and of itself is not enough; it must always be linked to how the world can be changed” (p. 217), a position that resonates with Mezirow’s (1990) idea that critical reflection is necessary for changing both how teachers teach and learners learn—what he termed *transformative learning*: “Reflective discourse and its resulting insights alone do not make for transformative learning. Acting upon these emancipatory insights, a praxis is also necessary” (Mezirow, 1990, p. 354). Furthermore, that praxis requires goals which, in the context of preparing teachers for diverse student populations must rest in educational equity and social justice—otherwise the “emancipatory insights” of critical reflection, no matter how important to the individual, cannot translate to collaborative action for community benefit. Accordingly, Liu (2015) links the practice of critical reflection with the goal of transformative action for social justice, defining critical reflection as

a process of constantly analyzing, questioning, and critiquing established assumptions of oneself, schools, and the society about teaching and learning, and the social and political implications of schooling, and implementing changes to previous actions that have been supported by those established assumptions for the purpose of supporting student learning and a better schooling and more [just] society for all children. (pp. 10–11).

Liu (2015) articulated a full processual model of critical reflection for transformative learning based on Brookfield’s work, including a cycle of six steps of assumption analysis, contextual awareness, imaginative speculation, reflective skepticism, reflection-based action, and reflection on reflection-based action (See Liu, 2015, p. 148 for detailed description of the six steps). Fig. 2 provides a visual representation of the hermeneutic cycle of critical reflection for transformative learning.

Critical reflection can effect changes at the classroom level, but what about the larger institutional changes that are also necessary? Here we turn to generativity for an answer. Generativity is the generation of new or novel behavior in problem solving (Epstein, 1996), a complex psychosocial construct that describes how an individual responds to societal demands, inner desires, conscious concerns, beliefs, and commitments. The concept includes productivity and creativity to make the world a better place; it also manifests as a concern for one’s legacy that leads to concrete goals and transformative action.

Research on generativity over the past seven decades suggests generativity is a formal, predictive theory of creative behavior or activity on the part of individuals. Ball (2009), noting that teachers are faced with societal demands to which they must respond creatively, proposed that generativity provides a framework explaining the process by which teachers engage in transformative change of the classroom lives of diverse student populations. Given that nearly 40% of teachers entering the classrooms report feeling unprepared for the challenges that await them, generativity could also guide teacher educators in their transformation of program practices. Ball (2009) thus combined generative theory and teacher efficacy in a model designed to prepare teachers who believe in their potential ability to affect positive change in the lives of their students and who also think in generative ways that result in transformative action in their classrooms. Ball’s model of generative change includes four stages facilitating teachers’ development of a change-oriented mindset, prompting metacognitive awareness, a sense of agency, a sense of advocacy, and the development of a personal voice concerning the education of diverse students. The figure below illustrates Ball’s model as

Model of Generative Change: The Processes Through Which Teachers Develop Voice, Generativity, and Efficacy in Their Development Toward Transformative Change

Fig. 3 Model of generative change (Ball, 2009).

a series of steps by which individuals move from metacognitive awakening to their own sense of efficacy to becoming transformative intellectuals (Giroux, 1988) able to reshape curriculum, pedagogy, institutional structures, and classroom practices. The result is the preparation of teachers who are agents of change rather than objects of change, forging new relationships between teachers and students, schools and communities (Fig. 3).

In the context of preparing teachers for a diverse student population through community-based teacher education, it is important first that the steps be infused with insight from Critical Race theory, and second that there is systematic movement from rethinking basic assumptions and obtaining critical awareness to generating new knowledge and taking action to transform learning undertaken in collaboration by both education professionals and the students and families in the community. Combining this collaborative process with Critical Race theory provides two vital affordances to community-based teacher education. First, it provides clear guidance for all parties in identifying the problems afflicting the educational system and actively searching for alternatives to the ways in which students and families are failed by our current educational systems. Second, the frameworks of critical reflection for transformative learning, and generative change when adopted collaboratively by educators and communities, can help all parties generate new knowledge and develop into transformative intellectuals (Ball, 2009; Giroux, 1988). According to Ball (2009), the knowledge becomes generative “when the teacher continues that learning by making connections with his or her students’ knowledge and needs and begins planning the teaching based on what he or she is learning” (p. 48).

Finally, critical reflection for transformative learning and generative change provide valuable frameworks for teacher educators to conduct research on the content of and procedures for prospective teachers’ reflection on teaching diverse students (see, for example, Ball, 2009; 2021; Liu, 2015; 2017; 2020). It further provides a critical lens to guide teacher educators to conduct research on the real actions of prospective teachers in their teaching—whether or not their reflection brings about transformative and generative actions in teaching diverse students. Research based on classroom actions as well as written reflections can help teacher educators gain a better understanding of how to improve their own support for prospective teachers to achieve transformative learning. Therefore, the frameworks, on the one hand, point out the importance of focusing on prospective teachers’ teaching practices and, on the other hand, guide teacher educators to analyze prospective teachers’ actions to determine whether or not they are transformative in terms of teaching diverse learners.

Conclusion

Given the experiences in the US with preparing teachers for diverse student populations, both the positive efforts as well as the limited results, what lessons can be drawn that would be valuable in other countries? First, in the US, race and racism are the central division between the dominant majority and the minoritized populations. Because US racism developed inseparably with more the broader practices of Euro-American colonialism—fundamentally linked through systemic slavery at home and abroad—US-style race and racism are common worldwide, as evidenced by phenomena such as the global practice of Blackface in popular culture, which perpetuates the pervasive stereotypes of Africans and African Diasporans as backward, primitive, highly sexualized, and dangerous (Thelwell, 2020). However, there are parts of the world in which this US.-centric notion of race is not central to the denial of social justice and educational equity. Nevertheless, if we abstract from the US case to think in terms of dominant majorities versus disadvantaged minoritized groups, the insights drawn from the example of the US can still apply. The educational system in the PRC, for example, is primarily constructed with reference to the urban population; rural schools are often treated as an afterthought in terms of funding and specialized curricula (Zhang et al., 2015), and students from rural areas who migrate to urban areas are typically approached from a deficit view (Meng, 2008), much as minoritized students are treated in the US system.

From this standpoint, the limited success of multicultural education stemming from its instrumentalization by teacher education programs and the subsequent weakening (or eliminating) of its critical edge hold a warning for other parts of the world: attempting to address minoritized students by “sensitizing” a system of schooling that remains primarily run by and for the dominant group is unlikely to produce transformative results. Similarly, the role of Critical Race Theory as a vital roadmap to understanding, critiquing, and intervening in unjust schooling in the US cannot be applied unmodified in other parts of the world. However, the basic tenets of Critical Race Theory—that one should focus on the actual lived experience of minoritized groups under schooling designed by and for the dominant groups, and that the fact of that domination conditions the systems and practices throughout schooling—can form the basis for tailoring the other aspects of Critical Race Theory to specific contexts.

Finally, the models of critical reflection and generative change, coupled with the goals of social justice and educational equity, are not tied to the concepts and circumstances found in US education, but are broadly applicable worldwide. Indeed, although the models were built with specific reference to the Euro-American tradition of reflection, critique, and praxis, similar traditions are found around the world whether based in religious disputation (Buddhism and Islam, for example) or more secular educational traditions (such as Confucianism and related philosophical traditions in China and across East Asia). In fact, because the key relationship to be invigorated is that between schools, teacher educators, and the community in which they are based, localization of both inspiration and working method is vital to the successful preparation of teachers for diverse student populations.

Aim of the article

The article aims at comparing traits of the teaching profession and more established professions to identify how teacher education programs can support the development of a *knowledge-producing* teaching profession. Historic relations between church and school are outlined, the school organization and relationship between teachers and their leaders discussed and traits of the teaching profession compared to those of more mature professions. In conclusion, prerequisites for a university-based study program that can strengthen the teaching profession are presented by indicating how school-university partnerships should be organized, structured, and led to cumulatively build a knowledge base, upon which teachers can enact their professional discretion.

Teacher education—a scattered picture

The last decades, many countries have reformed their teacher education, in the hope that program change can improve schools, but with few attempts to identify lessons learned from specific reform efforts and from developments in other professions (Zeichner and Liston, 1990). It is a problem that many of the reforms have not addressed fundamental structural problems or contributed to increased coherence in teacher education programs (Grossman et al., 2008). Mayer and Oancea (2021) noted that quite often, reviews of teacher education research find the field underdeveloped, small scale, undertheorized, fragmentary, and somewhat parochial. They therefore concluded that much teacher education research has minimal influence on policy other than being used as a weapon to advance competing views or manufacture narratives of failure. For instance, Cochran-Smith et al. (2017, 572) described how the US approach early 2000 was to “hold teacher education accountable,” by assuming that enhanced teacher education quality depended on evaluation and monitoring of outcomes related to institutions, programs, and teacher candidates. In Australia, Mayer et al. (2017) found teacher education positioned as a policy problem and newly educated teachers were expected to be instantly classroom ready, and effectively able to enhance students’ learning outcomes.

In the mid-1980s, Darling-Hammond (1985) suggested to professionalize teaching and teacher education, and early 2000, Cochran-Smith and Fries (2001) noted international moves in this direction. In many countries today, those who want to be teachers can choose integrated programs at universities or colleges. They can, however, also choose among a variety of short courses under umbrella terms such as Teach for America, Teach for All, School Direct and Teach First. These programs are typically based on training in school by more experienced teachers and summer school courses. On this background, Darling-Hammond (2010) noted that teaching is currently where medicine was in 1910, when aspiring doctors could take 3-week training programs, memorizing lists of symptoms and cures or they could attend Johns Hopkins University graduate school, that prepared doctors in clinical practice and the sciences of medicine.

In terms of speed and ambition, the development of teacher education programs differs across nations. In Finland, politicians decided to move teacher education from seminaries to universities in the 1970s (Simola et al., 1997). Iceland transferred teacher education to tertiary level in 1971 (Bjarnadóttir, 2008), and a 1977 reform in Sweden, gave the responsibility of educating teachers to universities and university colleges (Lundahl et al., 2010). Around the turn of the century, Erixon et al. (2001) noted that while all teacher education programs (preschool, primary school, upper secondary school) in Finland and Sweden were integrated and university-based, Denmark had no university-based teacher education program. During the 1970s, Norwegian teachers were prepared in two- or three-year *teacher education schools*, that replicated the seminar tradition. The first Norwegian White Paper with references to the *teaching profession* was published in 2009 (Ministry of Education and Research, 2008–2009), and in 2017, some forty years after neighboring Nordic countries, Norwegian politicians decided that primary teacher education should be at Masters’ level.

In England, a 2011 White Paper referred to teaching as a *craft*, with skills that are better trained in schools (Browne and Reid, 2012). The idea that central government is not only deciding *what* should be taught, but also *how*, is, according to Furlong et al. (2008) a result of Thatcherism and New Labor's Third Way-policy, and a contribution to *de*-professionalizing teachers (Beck, 2008). Having compared reform initiatives in the UK and Sweden, Weiner (2002) concluded that while Britain chose to respond to problems in the 1990s by creating a crisis of confidence in teachers and teacher education, impose regulations and limit teachers' autonomy, Swedish reforms aimed at greater coherence between different routes and raising the status of teachers by substantially increased research funding connected to schools and teachers' work.

According to Darling-Hammond (2012), exemplary teacher education programs are characterized by regarding teachers as professionals, a focus on learner- and learning-centered pedagogy, and holistic performance assessments. Strong university-based programs are mostly staffed by researchers who study teacher education, demonstrate a thoughtful balance between theory and practice, coherent curricula, and carefully structured clinical experiences with partner schools. They draw on complex and varied knowledge and see students' development as integral to the social contexts. Having compared three teacher education programs (Utrecht University in the Netherlands, Queen's University in Canada, and Monash University in Australia), Korthagen et al. (2006) argued that there would be no real changes in teacher education, unless teacher educators started modeling the practices they talked about. Having analyzed 20 articles published between 1983 and 2002, they found that good teacher education programs helped students develop their professional discretion. These programs centered around the student teachers, who worked inquiry based and collaborated in professional learning communities where they learned how research informed their practice. A core characteristic of programs was strong partnerships between universities and schools, and a joint understanding of the relationships between teaching and learning.

To sum up: There are, globally, huge differences in how teachers are educated and followed up. Problems related to shifting education policies, the low status of teacher education at universities and teachers' weak professional status, contribute to shaping the teaching profession. It is therefore interesting to compare the teaching profession to other professions.

Characteristics of professions and semi-professions

Researchers (e.g. Brante, 2013; Darling-Hammond, 2013; Morris et al., 2006; Simons and Ruijters, 2014; Lillejord and Børte, 2020b) agree on these characteristics of professions: They are (1) exposed to long, specialized, systematic, academic training followed by exams and certification that distinguish them from the non-certified. Professions develop their leaders through specialization and qualification and their associations ensure the quality of the professions' work and sanction unprofessional conduct. (2) Professions use their discretion to decide upon proper interventions on a joint knowledge base from research and experience. The professional collective shares the responsibility to renew and maintain the knowledge base, agrees on characteristics of reliable and valid knowledge, and develops standards for good practice. (3) Professions adhere to a societal mandate; they help people and provide services of high quality and societal relevance. (4) Professions are collegially organized with a high degree of autonomy. Their work is complex, tasks are heterogeneous and best solved collectively, in accordance with ethical guidelines.

In contrast to this, Etzioni (1969) labeled occupations rooted in care and calling such as teachers, nurses, and social workers, as *semi-professions*, based on the following arguments: semi-professions have shorter education than the established professions, they follow standards and work procedures developed by external actors and communicate knowledge rather than create it. A fragmented teaching corps, internal disagreement on fundamental issues, and the absence of professional organization positioned teachers not as respected experts of the field, but as "street-level bureaucrats" (Lipsky, 1980), responsible for implementing decisions from above.

When elaborating on the idea of an occupation as a "calling," Gustafson (1982) noted that *calling* refers to moral and religious motives and to a vision of the larger ends and purposes that work serves. In contrast, professions are characterized by mastery of technical knowledge, concepts and theories that guide choices, institutionalization that exercises social controls, and a service orientation. Therefore, he argued, "calling" without professionalization is inept, and a profession *without* a calling lacks moral and humane roots, loses human sensitivity, and restricts the vision of the purposes of human good that are served. Core characteristics of professions are therefore certification (Freidson, 1988), long, specialized education, a societal mandate, a value foundation, ethics and collective, continuous knowledge development. Taking a historical perspective on knowledge and learning, this article focuses primarily on the latter.

Professional education—historic background

Universities have a long tradition of educating professionals, with theology, medicine, and law as the medieval and early modern *learned* professions. Research-based education, global agreement on standards and professional organization, has proven successful for physicians and lawyers, who still rank high on lists showing the relative prestige of occupations (Ingersoll and Collins, 2018). Compared to the professions that emerged during the 20th Century, most teachers were, historically, educated in seminaries. Except for teachers who taught students in the medieval Cathedral schools, and teachers in contemporary upper secondary, who hold degrees in their teaching subjects, teachers' education has, in general, been shorter, less

research-informed, and often focused on instructional delivery. Teachers' main task has been to *communicate* knowledge to students, and to test how well students remember what they have been taught. This understanding of what it means to know and learn can have emerged from the historic ties between the Church and the schools that for centuries have influenced educationalists' perceptions of teaching.

Mamadailiev et al. (2019) described how the elementary school system in Prussia, Germany evolved during the 1700. Instruction centered on catechism and studies of the Bible. Teachers were candidates of theology, and the first German seminary for school-teachers was established in 1778. Gradually, central government took control over educational institutions. Under the chairmanship of the Minister of State, and directly answerable to the King, several secular members constituted local educational authorities. Cremin (1953) described US education as characterized by vast differences in quality, availability, and organization. There were three kinds of schools: elementary schools (reading, writing and religion); secondary or grammar schools (preparing young men for college) and colleges which taught liberal arts programs (languages, mathematics, and the classics). Many US teachers were clerics who prepared for teaching through seminaries and shorter courses (Mehta, 2013). As the need for education increased, secular subjects were introduced. Men unfit for manual work and more females entered teaching, and between 1880 and 1920, US education was institutionalized in a process that, according to Mehta (2013, p. 11) transformed a "nation of one-room school-houses into a network of district school systems." Mostly male superintendents were empowered as CEOs to lead mostly female teachers who were expected to follow rules and programs prescribed by their superintendent. From this emerged the idea that the complex practice in need of attention was not teaching, but *administration*. A new class of male administrative professionals elevated themselves by distancing themselves from the teachers.

In his analysis of educational organizations, Weick (1976) noticed that in schools, two loosely coupled systems appear to work separately from each other, with little transfer of knowledge across systems. One system consists of teachers, parents, students and curriculum, another of the principal, vice-principal, and superintendent. The two systems are somehow attached, but each part preserves its own identity, and there is little transfer of knowledge. While teachers are responsible for the schools' "technical core," the principal holds the authority of office. Teachers' autonomy and reluctance to change is often cited as the prime reason for reform implementation failure in schools. Instead, Mehta (2013) argued that a root problem in the educational sector is that it is organized as a bureaucracy rather than as a profession and suffers under the absence of an "educational infrastructure" to support practice.

Perspectives on the organization of schools

All *waste* in education, argued Dewey (1915), is the result of organization, or the lack of it, as organization is often motivated by economy and efficiency. The educational system has, historically, grown from the top-down, with different historical purposes and each part isolated from the others. While the university has its roots in the Middle Ages, kindergartens were established in the 1900s. As Latin, and Greek, during the Renaissance, connected people with the culture of the past, this was reflected in the grammar school, which primarily aimed at *cultivation*. The rationale behind the primary school was *utility*, as it became a business necessity to know how to read, write and figure during the 1500s. Late 1700 and early 1800, the training schools for teachers, should train persons *how* to teach, while the college taught them *what* to teach—with almost a contempt for methods of teaching: "In this division between what to teach and how to teach, each side suffers from the separation" (Dewey, 1915, p. 44).

The historic ties between the Church and school brought clerical practices to schools. The links between preachers and teachers, theology, and pedagogy, positioned the Church as the school's parent. Pedagogy was not among the learned sciences, and teaching was modeled on preaching and lecturing. As secular subjects were introduced, textbooks substituted the catechism, and subject knowledge substituted Biblical knowledge. In both cases, knowledge was regarded as external, transported into schools by teachers, who interpreted, adapted, and transmitted it to students. Discipline and upbringing were important; students listened to the teachers' lectures, were expected to remember what was taught, and their knowledge tested. For centuries, this has influenced our ideas about how we learn. Using examples from college teaching, Smith and Waller (1997) referred to this understanding of teaching as *the old paradigm*: Teachers *give* knowledge, students *get* it. Students sit quietly at their seats, eyes front, feet on the floor, as passive recipients of knowledge. Assessment is "objective" and students expected to memorize and recall relevant information in tests. Anyone with expertise in their field can teach without training.

In his analysis of how teachers taught between 1890 and 1980, Cuban (1984) concluded that teacher-centered practices dominated. Characteristics of these practices were whole-class instruction, that teacher talk exceeded student talk during instruction, teachers determined the use of class time, and the classroom was usually arranged into rows of desks facing a blackboard. Later, Cuban (2013) argued that the dominant policy strategy, to change teachers, had failed because it did not take the situation in which teachers find themselves, their *context*, into consideration. He referred to this as a fundamental attribution error, undervaluing the power of the age-graded school, particularly the way it isolates teachers from one another and discourages collaboration. Schools have a long history of isolating people from one another and separating teachers from their leaders.

Mehta (2013) argued that, from a sectoral perspective, American schooling is *organized backwards*, when compared to both medicine and higher achieving educational systems. By this, he meant that the educational authorities aim to accomplish on the back end—by holding teachers accountable—what is not done on the front end—building a system that is reasonably expected to consistently create good results. He asked if the downwards spiral of distrust, external regulations, and increased accountability, which

makes teaching less attractive to talented people, could explain the under-professionalization of teachers. [Ingersoll and Collins \(2018\)](#) argued that mature professions exert substantial control over the curriculum, admissions, and accreditation of professional training schools; set and enforce behavioral and ethical standards for practitioners; and exert substantial control over who their future colleagues are to be. As teachers, in contrast, have limited authority over their work, they cannot be held accountable for activities they cannot control.

Practice-shock—the theory-practice problem

As both teachers ([Colognesi et al., 2020](#)), nurses ([Duchscher and Windey, 2018](#)) and health professionals ([Opoku et al., 2020](#)) are reported to experience practice-shocks when they start working, some argue that their education should be more practice-relevant. The practice- or transition-shock is related to the theory—practice-problem. The idea that theory can be transferred to students through lectures, and that student teachers can “use” the knowledge from the lectures in their teaching practice, was labeled *technical rationality* by [Schön \(1983\)](#), and by [Doyle \(1990\)](#) a fragmented and mechanistic understanding of teaching. As indicated, it can also be a cultural reminiscence (relict) of clerical practices and a result of how schools are organized and led—on principles of economy and efficiency.

The practice-shock is part of a problem complex encompassing high rates of dropouts and too many newly qualified teachers who quit. [Kelchtermans \(2017\)](#) observed that while teacher attrition and retention were presented as complex, multilayered issues, the concepts were not clearly defined. He therefore suggested to see teacher attrition/retention as two sides of the same coin, where *attrition* describes teachers who leave the profession before having reached the age of retirement, and *retention* refers to keeping teachers in teaching. As we can imagine situations where it is favorable for both teachers and students if teachers leave the job, both attrition and retention is meaningless without a simultaneous reference to what constitutes good teaching. [Kelchtermans \(2017\)](#) therefore suggested seeing questions of attrition and retention as the need to prevent good teachers from leaving the job for the wrong reasons. Also, [Ingersoll \(2001\)](#) argued for a broader perspective, for instance to study teacher attrition/retention at the school organizational level.

[Voss and Kunter \(2020\)](#) found that studies of beginning teachers often followed two research strands, one focusing on teachers’ beliefs, the other on beginning teachers’ emotional exhaustion and stress. Induction periods and mentoring are frequently suggested to remedy their situation ([Paula and Grinfelde, 2018](#)). However, [Kelchtermans \(2019\)](#), argued that many support initiatives are caught up in deficit and remedial thinking with negative and even counter-productive side effects. Instead of interventions to support early career teachers in the induction phase, he suggested to see them as *sense-making agents*, *networkers*, and *assets* to the school. Instead of assuming that new teachers *lack* competence, schools should emphasize their agency: the capacity to interpret and judge the situations they find themselves in and to act upon it. As individual actors, teachers are situated in complex social relationships. Early career teachers often question existing practice, and should be regarded as assets to the school. In a study of how primary schools in the northern part of Norway welcomed the first students with master theses from the university, [Jakhelln et al. \(2016\)](#) concluded that neither teachers nor school leaders showed interest in the topics of their thesis. They also ascribed little value to the research skills that the students had developed during their education.

Many countries have tried to solve the theory-practice problem by transferring the responsibility for teacher education from universities to schools. This, argued [Ellis \(2010\)](#), will not solve the more fundamental problem, which is how teachers’ professional knowledge can be strengthened through a synthesis of research (theory) and practice (experience). While students learn a lot from practical experiences in schools, they do not learn how they can criticize practice to improve it, a prerequisite in the development of professional knowledge. Similar arguments were put forward by [Lillejord and Børte \(2020a\)](#), who conducted a systematic review and found that middle leaders in school rely solely on experience in their practice. [Ellis \(2013\)](#) argued for rethinking the division of labor between universities and schools as university staff spend too much time on students during their school placements, and [Ellis and McNicholl \(2015\)](#) suggested that the time researchers at universities spend on “relational work” with frustrated students, they should rather spend on research. This indicates a need to strengthen schools’ awareness of their important contribution to teacher education and schoolteachers’ competence as teacher educators.

[Grossman et al. \(2008\)](#) argued that the move from a teacher education curriculum organized by knowledge domains to a curriculum organized around professional practices requires that teacher educators *first*, must develop programs that undo the historical separation between foundation and methods courses; *second*, help novice teachers develop and refine a set of core practices for teaching. This requires changes both at the pedagogical and organizational level of teacher education, and at the collaborating institutions.

This section has shown that historically, knowledge has been regarded as external to the school. It has been transported into schools in books, and teachers have interpreted and adapted the subject knowledge students are expected to learn. Students come to school to get knowledge, and early career teachers to get teaching experience. Both groups are treated as if they *lack* knowledge and skills. The schools’ response to this deficit is supervision and mentoring by experienced teachers. There are complaints about the low practice-relevance of teacher education, and these complaints often come from schools, with the responsibility for the practicum part of teacher education. This paradox can indicate that schools need to learn about their own knowledge processes and develop a meta-perspective on their knowledge work.

Way forward: more symmetric partnerships in teacher education

Having outlined historical, structural, and organizational problems in teacher education, this section discusses prerequisites for how university-based study programs can contribute to strengthening the teaching profession. How school-university partnerships should be structured, organized, and led to cumulatively build teachers' knowledge base will be emphasized.

Maandag et al. (2007) compared partnership models in England, France, Germany, The Netherlands, and Sweden, and identified these partnership models: Work placement, training schools and training in and within schools. The dominant model was work placement. Mehta (2013) suggested to change the current model where teacher training institutions are responsible for teacher preparation during student teaching or the first year of teaching, and after that, districts are responsible for induction. Instead, he suggested, teacher education could learn from medicine and develop an apprenticeship program akin to the medical residency system. It would make more sense, he argued, to unite these functions under single institutions that would oversee teachers' development during their first three years of teaching.

In a research mapping of studies on partnerships in teacher education, Lillejord and Børte (2016) found that researchers described partnerships as complex and resource-intensive cross-institutional infrastructures for knowledge sharing, with the ambition to bridge theory and practice, enhance the practice-relevance of teacher education, and support mentoring and professional learning. An early model of integrated teacher education was the Oxford Internship Scheme, developed in the mid-1980s to strengthen connections between the theory students met at university and what they experienced in schools (BERA, 2014). Around the same time, in the US, the Holmes Group developed teacher education partnerships based on clinical practice (Kochan and Kunkel, 1998). How well school-university partnerships function, depend on how they are structured and led, responsibilities defined, and work divided. Studies included in the research mapping revealed asymmetric power-relations and tensions at all levels and emphasized the need for competent academic leadership in the establishment, running and renewal of partnerships. A major challenge is how to establish and maintain productive learning relations between the partners.

Zeichner (2010) argued that weak integration of the schools' contribution to teacher education is a big problem. The triad student-mentor-supervisor frequently causes misunderstandings and disagreement and real collaboration between schools and teacher education institutions is difficult to achieve. Allen et al. (2010) found that teachers and academics lacked understanding of the other party's knowledge culture. Partners appear to live in separate worlds, with separate communities. Strategic leadership is needed to improve the dialog between the parties, and the optimal solution appears to be concrete collaborative projects in which the partners jointly create a shared product. Studies reported reluctance in challenging the tradition where students are first presented the theory they later are expected to "practice." An alternative to this model is to design a study program where students simultaneously investigate instructional practice through first-hand experience and read relevant research. Here, research and practice are perceived as two different, but equally important sources of knowledge. This approach gives students an opportunity to synthesize experience-based knowledge and knowledge from research and prepares them for challenges they will encounter as teachers.

The mapping revealed that the concept "third space" is frequently used in research on partnerships, based on the assumption that collaboration need neutral ground for deliberation. In *third space* university supervisor, school mentor and student step out of their own field of knowledge, to jointly create new knowledge. While the ideal is symmetric relations between participants, the triadic collaboration caused tensions and disagreements in the relations between mentor-student, mentor-supervisor and supervisor-student. As the student is dependent on both supervisor and mentor, the three parties are not partners on equal terms. Students were often entangled in conflicts of loyalty and had to choose side. Problems were related to asymmetric power relations, imbalance between the professional and personal, in-fighting over who was the expert and different ideas and expectations on how to teach and develop professionally.

As some partnership models can be dysfunctional, there is an obvious need for innovative thinking in teacher education partnerships. Lillejord and Børte (2016) suggested to place the students' learning at the center of activities in a model where both mentors in school and supervisors at university would have to relate to both research and practice. The tension between theory and practice can be eased when none of the parties may claim exclusive "ownership" of one knowledge area. Such a model also supports knowledge development because all actors must cross boundaries and relate to various types of knowledge.

This article has asked if a core problem in teacher education is that teachers in school primarily perceive knowledge as external to the school. While they interpret and communicate this knowledge, they do not, themselves, systematically *produce* knowledge. This is one of the traits used to distinguish semi-professions from more mature professions.

Reflective practice has been promoted as an approach to increase teachers' understanding of their work. Russell (2013), however, asked if the strong belief in reflective practice has done more harm than good because teacher educators rarely explain what they mean by reflective practice or model it, and generally fail to link reflection clearly and directly to professional learning. Therefore, teacher candidates tend to complete the program with a muddled and negative view of what reflection is and how it might contribute to their professional learning.

Professions' knowledge base consists of various knowledge sources, the two most important are experience and research. When it comes to research use, teachers are reported to lack information literacy (Williams and Coles, 2007). Wieser (2016) noted that teachers used practical knowledge when planning their teaching, and personal knowledge when reflecting on it. They do not have the competence to interpret research so that it becomes relevant for their own practice, which they see as essentially unique, extremely complex, and unsolvable by research (Cain, 2016). One solution to this problem is to establish partnerships where teachers and student teachers collaboratively work to investigate and document their practice. Professional practice is a knowledge

form that should be collected, discussed in the professional learning communities, criticized, compared to findings from research and improved. Increased understanding of the schools' own knowledge can support teachers' use of research and data literacy.

To sum up: There is, globally, huge differences in how teachers are educated and followed up. Problems related to shifting education policies, the antagonistic relationship between school leaders and teachers, coupled with the low status of teacher education at universities, contribute to shaping the teaching profession. In addition, a strong belief in external knowledgeable experts such as consultants or market agents, has hampered the development of a strong teaching profession (Lillejord and Børte, 2020b). As established professions have systematically built their knowledge from within, this is also the way forward for the teaching profession.

Introduction

Addressing educational inequalities in the 21st century need to have teachers prepared to work effectively with students, their families and their communities, especially with those from vulnerable populations. Indeed, the role of teachers is crucial to creating optimal conditions for learning and development. Granted that without authentic knowledge of the community culture prospective teachers will not have the context they require to be effective teachers (Zygmunt and Cipollone, 2019), current research in the science of learning and development emphasizes the importance of connecting teachers with family and community contexts (Darling-Hammond et al., 2020). Hence, educators need to be prepared to develop strong and respectful relationships by understanding and building on children's knowledge and experience, which are shaped by teachers' interactions with their families and their communities in a particular socio-cultural context (Vygotsky, 1978; Flecha, 2015). In the current situation, where educational inequalities have been exacerbated even more due to global crises, such as the pandemic or the war, community-engaged teacher education emerges as a transformational pathway to prepare teachers to work effectively with students, particularly with those from vulnerable communities, and to deeply engage with those who have suffered systematic marginalization. This should ultimately contribute to guaranteeing the right of every single child to an inclusive and quality education for all (United Nations, 2015).

Several social-justice scholars have developed frameworks and programs to prepare excellent, socially just and equity focused teachers to work for and alongside vulnerable communities (Lampert, 2021; Zygmunt et al., 2022; Cochran-Smith et al., 2016; Villegas, 2007). These models are conceived within innovative and transformative paradigms aiming at advancing educational equality. Thus, the Australian approach to building community engagement starts from the premise that "deeper engagement with vulnerable communities has the potential to develop community-engaged, culturally responsive [anti-deficit] teachers who are prepared to both reach and teach children" (Lampert, 2021, p. 457). It aimed at developing teacher education programs in Australia that train teachers to respect local and contextual differences of communities and incorporate what they have learned into their work. Along these lines, the Nexus program (Lampert and Browne, 2022) was designed to prepare a small, carefully mentored cohort of teachers for hard-to-staff, low socio-economic status schools in urban and rural Victoria in Australia by incorporating a new school-embedded Master of Secondary Teaching with community engagement at its core (p. 149). It examines applicants background, commitment to social justice, among others to consciously recruit a high number of culturally diverse teachers (Lampert and Browne, 2022) paving way for the debate on teacher quality and efficiency (Anagnostopoulos et al., 2016). Nonetheless, the approach enabled designers of the program to understand candidates' beliefs and to explore their interpretation of social justice in order to design a teacher education course on the principles of community engagement and social justice (Lampert and Browne, 2022).

This is consistent with the community-engaged teacher preparation approach that has envisioned a better future for minority students in American schools by privileging the knowledge and expertise of their communities and elevating people's funds of knowledge (Moll et al., 1992) and community cultural wealth (Yosso, 2005). Importantly, community-engaged approach to teacher preparation differs from what is known as community-based initiatives, which simply considers being placed in a community, and it emphasizes the need to "authentically integrating educator preparation programs into historically marginalized communities" (Zygmunt et al., 2022). Likewise, engaging pre-service teachers with adult community members as part of their preparation in a predominantly African American neighborhood in the United States led to teachers' becoming more adept in cultural understanding and acquiring an asset-based mindset as opposed to a deficit one (Keller, 2019). In South Africa, the model's positive impact contributed to the development of policies, standards and guidelines for the implementation of community engagement in higher education at the national level (Lazarus et al., 2008). Considering the history of African Americans in the United States and the Apartheid regime in South Africa, these demonstrably, reveal an approach to teaching and learning that advocates for equity among vulnerable groups.

Similarly, the dialogic approach to community-engaged teacher education has aimed at engaging teachers in transformative dialogs and interactions among them and within those communities who have systematically been marginalized to ultimately achieve

children's educational and social success (García-Carrión et al., 2017). Underlying this dialogic approach and aligned with other international perspectives on community engaged teacher preparation, there is the Freire dialogic action theory (Freire, 2003). Particularly, his notion of praxis—"the action and reflection of men and women upon their world in order to transform it" (p. 79) becomes essential for preparing teachers as agents of change in and within communities, especially with those systematically marginalized. For that goal to be achieved, community-engaged teacher education must be informed, on the one hand, by scientific evidence that has demonstrated to report educational and social improvements and, on the other, by the knowledge co-created in dialog with the community. This implies monitoring teacher education to achieve social impact (Flecha et al., 2019).

Indeed, providing the teachers with relevant knowledge is not enough: such knowledge has to be effectively used and fully transferred into practice to make the world a better place (Ball, 2012). This process requires, on the one hand, raising teachers' critical consciousness by discussing social impact research in education through egalitarian dialog, and on the other hand, the co-creation of new knowledge with families and communities for dismantling prejudices and deficit thinking (Valencia, 2010). This also implies a dialog that values their funds of knowledge (Moll et al., 1992) and builds on their cultural intelligence (Flecha, 2000). Within this approach all social actors -teachers, researchers, families, and communities-are mutually engaged in a partnership or network of knowledge-co-creation through dialogic learning as they have the shared purpose of creating optimal conditions for every single child to thrive.

This dialogic approach to community-engaged teacher education has been developed over three decades of collaboration between the Community of Research on Excellence for All (CREA) along with teachers, schools, and communities, including those systematically excluded and marginalized, living in high poverty areas. Indeed, this approach has nurtured community-engaged teacher education in Europe and South America. Transferred to many diverse contexts worldwide, the approach described here has shown to be applicable to any educational attempt in which children can benefit from teachers who are equipped with the knowledge and the commitment to transform schools into learning communities oriented to achieving educational and social success for all (García-Carrión et al., 2017).

Why do we need community-engaged teacher education?

Research have widely demonstrated that teacher education is a key factor in achieving school success, because it has the potential to influence students' learning and academic performance (Baker et al., 2008; Mutton et al., 2010; Herrera, 2018) and have a stronger effect on a students' academic outcomes than, for example, the pupils' socioeconomic status (Darling-Hammond, 2000). However, scientific evidence on teacher education might be insufficient if it does not reach vulnerable communities and address some of their most pressing challenges and needs. Indeed, tackling the challenge of preparing teachers to work in culturally and linguistically complex classrooms or in high-poverty schools have reflected the crucial role of preparing teachers within those communities (Ball, 2009; Lampert et al., 2017). Thus, teachers and teacher educators must work with under-represented communities to identify respectful models of engagement, especially with those people whose voices have been rarely included in educational discourses and practices (Lampert, 2021). Although community-engaged teacher preparation programs have already pointed out the need for establishing meaningful synergies among teachers-to-be (coming from the university) and high poverty schools, less is known about the most effective mechanisms for establishing such positive cooperation.

In this regard, a dialogic approach to teacher education opens the possibility for engaging in transformative interactions between teachers, students and community members, and it creates affordances for community-engaged teachers to act against inequity and exclusion. This approach is grounded on Flecha's (2000) dialogic learning. His conceptualization articulates seven principles that define those dialogs and interactions as (1) being egalitarian, (2) capitalizing on every participant's cultural intelligence, (3) provoking critical transformation instead of adaptation to the environment, (4) fostering the instructional dimension of dialog, (5) being solidarity-based, (6) sources of meaning making, and (7) allowing equality of differences. These principles guide the interactions and dialogs that teachers and learners engage with, not only among themselves, but also with their families and other community members (Flecha, 2015).

Hence, the community plays a major role and, if teachers want their children to thrive, they need to engage with their communities to transform the sociocultural context. Since cognitive development cannot occur outside of this context or independent of social interaction (Vygotsky, 1978), teachers need to engage with their students' cultural context and to consider those relationships in their preparation and in their professional development. Decades of research highlights the potential of this approach to enhance academic achievement and social cohesion even in schools serving pupils belonging to socio-economically disadvantaged households (Roma, migrants and refugees, among others) (Flecha et al., 2019; García-Carrión et al., 2017).

In this regard, community-engaged teachers develop specific structures and criteria that ensure the involvement of migrant and vulnerable groups in school daily life reporting benefits in student learning and social cohesion (Soler et al., 2020). Specifically, they encouraged families and community members to engage in educational activities, capitalizing on families' and communities' funds of knowledge (Moll et al., 1992) and dismantling the deficit thinking (Valencia, 2010). Accordingly, families and community members are perceived as a great asset and become teachers' allies to improve students' education but also reporting psychosocial benefits to the families and community themselves (García et al., 2019; Gírbés-Peco et al., 2019). As a historically situated social practice, community engaged teacher education is needed to ensure high-quality education for all, but specially, for students from historically marginalized groups.

The power of dialogic interactions between teachers, students, and communities

Using the dialogic approach to community engaged teacher education has enabled teachers to better understand how to face challenges they encounter when entering schools serving historically marginalized groups or located in high-poverty areas (García-Carrión et al., 2020). Furthermore, this approach has been transferred to many diverse schools worldwide and it has been widely applied and researched within the project “Schools as Learning Communities” which are grounded on the dialogic learning approach (Flecha, 2000). Currently, they form an international network of schools across countries and across educational levels from early childhood education to adult education, that allows for all children to achieve success regardless of their socioeconomic, ethnic, geographic or minority background, reversing the reproduction of social and educational inequalities (Soler-Gallart and Rodrigues de Mello, 2020). Dialogic interactions and the participation of the community are two main cornerstones of this project where schools implement Successful Educational Actions (Flecha, 2015) that are based on scientific evidence of the most fundamental theoretical contributions in education as well as on the most recent research findings. As a result of its impact, the European Commission (2011) recommended this model from preventing early school leaving that mainly affect vulnerable students, and it is defined as follows:

Schools as “learning communities” agree on a common vision, basic values and objectives of school development. It increases the commitment of pupils, teachers, parents and other stakeholders and supports school quality and development. “Learning communities” inspire both teachers and pupils to seek improvement and take ownership of their learning processes. It creates favourable conditions also for reducing school drop-out and for helping pupils at risk of dropping out.

European Commission (2011).

By engaging teachers in dialogic interactions with the communities, a dialogic space is created for them to overcome the pervasive deficit thinking about those historically marginalized and the “cruel optimism” of involving with vulnerable groups in superficial ways (Rasmussen, 2015). This occurs, for example, with in-service teachers in Schools as Learning Communities when they create a dialogic space to dream together with the entire community the school they want for their children and for themselves. Hence, they create a collective understanding of people’s needs and desires which often challenges prejudices, specially toward historically disadvantage groups such as the Roma. Indeed, the study conducted by García Yeste et al. (2018) showed a positive impact on Roma students and their families’ expectations to higher education, and how these high expectations affected also students’ outcomes. Thus, this model tears down the walls of hermetic schools where only high-educated ones can be part of the school (Souto-Manning and Swick, 2006). Since learning and development lie in the interactions children have with every person who is part of their contexts (not only schools, but playgrounds, neighborhood, families’ workplaces, among others), community-engaged teachers can open this opportunity to access high-quality and diverse interactions.

Pre-service teachers can also learn and engage in these dialogic interactions. Recent research involving 129 student teachers, 20 schoolteachers and 3 headteachers in Spain found that the gap between theory and practice in current teacher education can be reduced when student teachers are involved in schools where practices based on scientific evidence are implemented (Ríos González et al., 2019). In this regard, a volunteering program on Schools as Learning Communities was designed and implemented with student teachers who wanted to take part. Indeed, volunteering programs involving pre-service teachers have shown evidence of the improvement of children’s learning. By volunteering at the schools, pre-service teachers not only acquire meaningful and relevant professional training but also help the pupils to progress in their learning processes (Ríos González et al., 2019). This win-win equation is promoted under this dialogic approach to teacher education in Initial Teacher Training, through programs that aim to facilitate pre-service teacher involvement in Schools as Learning Communities.

Indeed, the experienced of pre-service teachers participating as volunteers in School as Learning Communities is shaped by transformative educational practices based on scientific evidence. This has been especially helpful to challenge their previous assumptions, such as misconceptions concerning the placement of migrant pupils in catch-up groups. As a result, the dialogic teacher training approach has changed the students teachers’ views of children with minority background, nurturing high expectations toward them. These first experiences are crucial since they will shape pre-service teachers’ future believes and practices (Ríos González et al., 2019).

Raising critical consciousness by discussing evidence with social impact

According to Freire (2003) critical consciousness is needed for the teachers to intervene in the world and transform that world. In his original term, *conscientização* enables a critical position in relation to power since it invites people to recognize reality and name social injustice. Dialogic teacher education fosters raising teachers’ critical consciousness as defined by Flecha et al. (2019: 2), it allows for “spaces of collective construction of knowledge through the connection of theory, practice, and research.” Importantly, those dialogs are oriented to use scientific knowledge to support teacher development toward a successful education for all, moving from assumptions in education to those actions that have provided evidence of educational and social improvements (Flecha et al., 2019). This is aligned with the international movement “scientific evidence-based teacher education,” which puts international scientific evidence at the service of educational improvement (Georgiou et al., 2020). However, accessing the knowledge is not

enough. Creating dialogic spaces in teacher education to successfully work with diverse students and communities is essential. This is precisely what Dialogic Pedagogical Gatherings (DPG hereinafter) have offered to foster community-engaged teacher education.

In this dialogic space grounded on an egalitarian dialog, scientific literature on evidence-based approaches to teaching and learning is read and discussed. Particularly, the most important contributions in the educational field are selected for discussion in each session of DPG, such as reference books on the latest contributions to learning and teaching, as well as research published in international peer-reviewed journals whose results have reported social impact (Rodríguez-Oramas et al., 2021). In such context, participants are exposed to a collective and collaborative reasoning regarding teaching, learning, and educational actions that have previously been implemented and that have improved learning outcomes (Roca-Campos et al., 2015). The readings discussed at the DPG are chosen by all participants, who often include not only teachers but also family and community members. Research conducted with in-service teachers (Roca-Campos et al., 2021; Rodríguez-Oramas et al., 2021) have reported a positive impact on teachers' ability to address current school problems and to transfer new knowledge to the classroom which turned into improving student learning. In addition, DPG also open the possibility to build partnerships in the community and create networks among pre-service and in-service teachers to discuss lesson plans and practices with colleagues, drawing on scientific evidence (Rodríguez et al., 2020).

Similar research on DPG has been conducted with Master students in their preparation to become secondary school teachers in a Spanish university (García-Carrión et al., 2021). This case involved 40 student teachers who engaged in meaningful and egalitarian dialog with their peers. Participants read and discussed Paulo Freire's "Teachers as Cultural Workers: Letters to Those Who Dare Teach" (Freire, 2009) on weekly basis. The DPG allow them to reflect and gain critical awareness in a space where all voices and beliefs, supported by arguments, are welcome. Interactions among pre-service teachers fostered their critical thinking and created opportunities for students to critically reflect on teacher skills and values, their role as teachers and their social self, which allow them to reshape their future practices (García-Carrión et al., 2021). Moreover, by engaging in egalitarian dialog through these readings, student teachers felt free to express their thoughts, feelings and beliefs regarding key issues related to education (such as expectations toward students, relationships with families, or dialogs with the school staff). In this dialogic space, future teachers' own educational experiences emerged intertwined with assumptions about ethnic minorities or other vulnerable groups. Once these thoughts were openly shared during the DPG, Freire's text itself and teacher students' desire to be coherent teachers soon allowed them to overcome certain prejudices and misconceptions.

Funds of knowledge and cultural intelligence to dismantle deficit thinking

Through the dialogic interactions they engage in and the common vision of the school they construct, teachers, families, community members and researchers develop trust-based relationships through egalitarian dialog (Khalfaoui et al., 2020). "Dialog is egalitarian when it takes different contributions into consideration according to the validity of their reasoning, instead of according to the positions of power held by those who make the contributions" (Flecha, 2000, p. 2). In egalitarian dialogs individuals support their views with arguments and hold an attitude of openness to rectification on the basis of the arguments provided by others. To achieve egalitarian dialog people should be allowed to engage in dialog using their funds of knowledge (Moll et al., 1992) creating an appropriate context for people to develop enough confidence and use their cultural intelligence (Flecha, 2000). Similarly, to the funds of knowledge, which are the "historically accumulated and culturally developed bodies of knowledge and skills essential for household or individual functioning and well-being" (Moll et al., 1992, p. 133), the cultural intelligence is, a set of academic, communicative, and practical knowledge and abilities that develop through experiences in life, and are used to solve problems in everyday life (Flecha, 2000).

By reflecting and interacting directly with people from historically marginalized groups in a context where people's funds of knowledge and cultural intelligence are valued and privileged, diversity constitute a cultural and cognitive resource with great potential for teaching and learning. Thus, teachers and children can capitalize on those resources to enhance their learning in the classroom. This occurs, for example, when teachers organize the classroom in Interactive Groups and volunteers from the community, including illiterate Roma grandmothers participate supporting small heterogeneous groups of students while they carry out curricular tasks (Valls and Kyriakides, 2013). This dialogic approach in the classroom counteracts the pervasive "deficit thinking" which "blames the victim" instead of examining how teachers and schools can be structured and transformed, such as in the Interactive Groups, to support vulnerable students in learning and succeeding at school (Valencia, 2010).

In this sense, prejudices and deficit views about minorities and vulnerable populations fade as the priorities of the community align with those of community-engaged teachers committed to provide the best education for all children. When those biases are overcome and the voices of all people are considered in an equal epistemological level, co-creation processes emerge. Such processes acknowledge that all individuals have inherent capacities for communication and social interaction, and that everyone can have their own understanding of the world, generate knowledge, and change social structures. This paradigm is reflected in the Communicative Methodology of research (Gómez et al., 2019), which has been used in the research conducted in Schools as Learning Communities being a useful tool for achieving socially useful results to achieve equity and inclusion, involving the vulnerable populations in the entire research process.

Schools that open their doors and value the cultural intelligence of all communities become a real arena where prejudices and deficit thinking are dismantled. These schools open meaningful opportunities for vulnerable groups to participate and be listened to and make available adults with different cultural backgrounds and profiles to interact with students on equal terms to promote the

success of all the children. This context is an optimal setting in which teachers can become a great resource for overcoming prejudice, precisely by engaging in real educational actions that transform difficulties into opportunities.

Conclusion

Community-engaged teacher education is a transformational pathway necessary to prepare educators to work effectively with learners from vulnerable communities and to extensively engage with students who have suffered systematic exclusion and marginalization. This is based on the principles of social justice and the premise that teacher education should involve and be engaged with the community in which the school is located to create opportunities for transforming current educational inequalities into academic and social success, thus, contributing to the social obligation of ensuring an inclusive quality education for all (SDG 4).

Despite the creation of innovative and transformative programs to advance educational equality based on community-engaged teacher education, there is an urgency for the most effective mechanisms of establishing such positive synergies between teachers and the community. The dialogic community-engaged teacher education approach projects a cross-cultural approach based on dialogic learning that addresses this challenge. Implemented in over a thousand schools worldwide, it creates an opportunity for teachers, students and community members to engage in transformative interactions establishing trust-based relationships. This creates affordances for community-engaged teachers to act against inequity and exclusion. Scientific literature emphasizes that this dialogic approach has great potential to enhance in-service and pre-service teachers' critical consciousness, transform their teaching practices to improve children's academic performance and social cohesion in culturally diverse settings.

If teachers want their children to thrive in an increasingly diverse society, they need to engage with their communities by valuing their funds of knowledge and cultural intelligence to transform the sociocultural context. Providing teachers with that knowledge is not enough, such knowledge has to be effectively used and fully transferred into practice to change schools and communities into places where the dream of an equitable and successful education for all becomes a reality.

Introduction

This article provides an overview of core issues in research on university–school partnerships in initial teacher education. The article shows how the notion of university–school partnerships can be conceptualized in several ways, with varying permutations and models of such partnership relationships. The article further identifies the key considerations for universities and schools, and outlines some of the challenges related to the implementation of such partnerships.

A few clarifications and delineations are relevant. The structure of initial teacher education programs varies widely across the globe, including in number of years of the qualification and length of time spent in schools. As it is impossible to do justice to all such structures, the discussion here is aimed more at principles of partnerships than at examples of specific strategies or programs. In certain instances, though, examples of interventions are given by way of illustration.

Initiatives to promote university–school partnerships can occur within the full range of a teacher education curriculum, including the subject-specific as well as the foundational disciplines. The focus here is on the school-based period of initial teacher education as this is where most of the relevant writings can be found. Different terminology for this school-based period is used across the globe, including practicum, Teaching Practice, clinical experience, clinical practice, field experiences, and work-

integrated learning; this article uses “practicum” to denote all of these terms. It is important, however, that the notion of “partnership” not be conflated with that of the practicum. While the practicum assumes a relationship between universities and schools, a partnership refers, at the very least, to a more systematic and formalized arrangement, with a recognized level of shared responsibility between universities and schools for the education of student teachers.

The field under consideration is very vast, and it is not possible to report on the full range of research available. The information presented has been gathered through cross-referencing of core articles in academic journals and edited books and a selection of country reports. Emphasis has been placed on overview writings, rather than on outlines of specific research projects or case studies, of which there are very many. Interestingly, the emphasis on academic articles as source material has meant that most of the information presented is from the perspective of the university; further referencing of perspectives from schools and teachers is encouraged.

Purpose of university-school partnerships

Forms of university-school partnerships may differ, nevertheless, all share certain common purposes. The most prevalent of these is to build bridges between the oft-cited divide between the world of “theory” (the university) and the world of “practice” (the school). A partnership is intended to create learning opportunities that enable student teachers to draw on the conceptual as well as the practical resources of the university and the school and, in so doing, to advance their understanding, insights and competences for teaching. Through gaining access to theoretical resources as well as to the professional knowledge of teachers, student teachers are seen to be in a stronger position to develop their own teacher identities and competences.

Despite this common purpose, the interest in establishing university-school partnerships may derive from different perspectives on the roles and contributions of each of the partners. In one approach, partnerships are seen as a way to address the critique that university-based teacher education prioritizes theory over practice (Cooper and Grudnoff, 2017), and the resultant disconnect between what students learn in initial teacher education and what they need to do in practice:

The notion of a “theory-practice gap” is based on the perception that university models of teacher education overly emphasize theory, values and beliefs at the expense of actual teaching practice, thus leaving new teachers on their own to implement or translate university-produced theory into classroom-ready practice

Cochran-Smith et al. (2020, 47).

A second purpose for partnerships argues for a reciprocal relationship between theory and practice, as opposed to a “theory-into-practice” or a solely “practice-based” approach (Cochran-Smith et al., 2020). Attempting to reverse a theory-practice binary, theory from this perspective sees practice as the source and center for professional reflection and development (Mitchell and Reid, 2017). Theory and practice are thus not seen as dichotomous, nor is practice seen as non-theoretical; rather theory and practice are seen as mutually and synergistically related (Cochran-Smith et al., 2020). Through building on such synergies, the intention is that both academic knowledge and pedagogical skills are strengthened.

In both approaches, the combination of theory and practice is seen as a way of preparing future teachers better for the world of work. The first approach, however, can be said to be more instrumental, as the emphasis is on the mastery of skills, and socialization into the world of the school (Orrell and Higgs, 2012). The second approach cautions against an uncritical celebration of practice, arguing rather for “new kinds of pedagogical and curriculum practices to emerge from a new configuration” (Boud, 2012: 55).

Benefits of university-school partnerships

University-school partnerships have been argued to offer significant benefits to the student teacher, the school and the university, thus holding the potential for supporting and improving teacher quality. The following are some of the benefits as highlighted in the literature:

- For student teachers, partnerships are said to offer more authentic learning experiences, more structured teaching practicum experiences and feedback from teacher mentors, and more varied opportunities to involve themselves in school activities (Darling-Hammond, 2010).
- Partnerships can provide opportunities for inquiry that brings together students’ university course-work theory with school-based practice (Zeichner, 2010).
- By integrating university theory with school-based practice students learn to “handle the problems of everyday teaching through theory-guided action” (Korthagen et al., 2006: 1021). In so doing, students learn to analyze and apply theory, reflect on practice, and have additional opportunities to retry and improve in their practice (Darling-Hammond, 2006).
- For the schools, the main benefit of partnership agreements is the opportunity that they provide for teachers to take time to reflect on their own practice as they mentor the students in lesson planning and classroom management (Green et al., 2020).

- Partnerships encourage teacher mentors to “consistently look at new and engaging pedagogies, as well as providing the stimulus to question traditional methods” thus contributing to the school-based educators’ professional development (Miller et al., 2015: 63).
- For university lecturers, the benefit of partnerships includes the development of contextual knowledge for teaching. Teacher educators are encouraged to keep up to date with the developments in schools and connect their teaching more closely with the complex realities within schools (Toon and Jensen, 2017).
- Authentic partnerships involve activities such as designing and evaluating programs, sharing data and information, observing and sharing teaching practices. When this takes place, Toom (2017) argues that partnerships play an important role in modeling teacher collaboration and collective curriculum work, as well as utilizing research on teaching and learning to develop innovative pedagogical programs through networked expert communities that involve university teacher educators as well as school-based educators.

The combination of these benefits is well summed up as follows:

Partnerships play an important role in producing and utilizing research on teaching and learning, implementing innovative pedagogical developments, modeling teacher collaboration and collective curriculum work, producing teaching and learning materials, as well as constructing and developing networked expert communities of TEs and school-based teacher educators. Furthermore, this helps teacher educators to keep up to date with school-based developments and contributes to school-based teacher educators’ professional learning and growth

Toom (2017).

Models of partnership

Partnerships may be constructed according to different models, each of which brings different priorities, expectations, roles and responsibilities for universities and schools. A number of different models as identified in the literature are outlined here; it should be noted though that these models constitute typologies. In practice, institutions are likely to work with a hybrid set of models as circumstances change over time, as different contexts and requirements emerge, or as particular relationships develop. Mixed models may even exist, as universities engage in a variety of arrangements with specific schools.

Furlong et al. (1996) have identified three “ideal-typical” models of partnership that were operating in the United Kingdom by the mid-1990s, namely higher education institution (HEI)-led, collaborative and separatist.

HEI-led

In the HEI-led partnership the school is seen as a resource that can provide practice-based learning opportunities for student teachers. The university defines the responsibilities of the school, and school-based mentors are expected to work according to these indicated tasks. Planning and monitoring are the responsibility of the university and is aimed at ensuring that students receive comparable learning opportunities at the different schools. While mentor teachers might be somewhat involved in the assessment of student teachers, this remains the primary responsibility of the university.

Collaborative

Within the collaborative model, teachers are seen as having an equally legitimate, but different body of professional knowledge from those in higher education. There is a negotiated relationship between the university and the school, and teachers and university lecturers work together to plan an integrated program of work for the students. Student teachers draw on, or may even critique, the different bodies of knowledge to develop their own professional identities and insights. Assessment is a collaborative responsibility of both the university and the school.

Separatist

In the separatist model schools and higher education institutions have different but complementary roles. Broad planning allows for the identification of agreed areas of responsibility. There is no systematic attempt to bring the worlds of school and university learning together and it is left to the student teacher to achieve integration of the two knowledge domains. Few opportunities for dialog exist between the university and the school and mentoring and assessment are primarily the responsibility of the school.

A complementary model

A second set of typologies identifies three conceptual models of university-school partnerships, namely collaboration, complementarity, and equivalence (Edwards et al., 2009). To this, these authors have added the concept of “community”, which they see as assimilating the characteristics of the other three concepts.

In a complementary partnership, the school and university are understood as distinctive entities with separate but complementary responsibilities. While no systematic attempt is made to bring the two dimensions together, a process of mutual renewal is envisaged through the symbiotic relationship that is established.

A collaborative model

In a collaborative partnership, teachers and lecturers work and plan together on a more regular and coordinated basis. Such partnerships require “personnel from schools and universities to engage mutually in negotiating the meaning of a shared agenda in which neither party’s meaning is privileged” (Edwards et al., 2009: 13). Collaborative partnerships include all members of the partnership—student teacher, teacher mentor, teacher educator—who work as a team toward a common professional goal. Collaboration between all stakeholders would therefore assist with the development of respect and understanding of one another’s roles and professional learning then becomes a non-hierarchical endeavor where each person’s knowledge and expertise is acknowledged equally (Payne and Zeichner, 2017).

An equivalent model

In an equivalent partnership, partners have equal status and share responsibilities in all areas, including planning, supervision and assessment.

A community of practice model

Drawing on critiques of the above models, Edwards et al. (2009) outline a shift in research literature toward the notion of “community” in university-school partnerships. Key concepts here are communities of practice, professional learning communities, or communities of inquiry. Learning is understood as a social process that involves “mutual engagement in a joint enterprise and participation in the negotiation of the meanings of a shared repertoire” (Edwards et al., 2009: 14).

Research and innovation

In this next conceptualization of partnership, the emphasis is on the promotion of research and/or curriculum innovation. Opportunities are created for student teachers and teacher educators to work with practicing teachers toward the advancement of knowledge on aspects of teaching and learning. The partnership is based on bringing “research-based understandings of teaching and learning into dialog with the professional understandings of experienced teachers” (Burn and Mutton, 2015: 219), thus promoting research-informed clinical practice. Examples of this model include the Oxford Internship scheme in the United Kingdom, Professional Development Schools in the USA, realistic teacher education in the Netherlands, and Teacher Training Schools in Finland (Burn and Mutton, 2015).

Darling-Hammond (2014) describes highly developed professional development school models in the USA as places where curriculum reforms are supported by the school and the district; teams from the university and the school work on curriculum development, school reform and action research; university faculty are involved in teaching and professional development at the school; and school educators often teach on the teacher education program. Most classrooms in these schools are sites for student teaching placements and cooperating teachers are trained as teacher educators and mentors. Some such schools explicitly include an equity agenda, thus helping student teachers to understand the broader institutional and social context of schooling.

A further example of a partnership aimed at promoting research and innovation can be found at the University of Johannesburg in South Africa (Henning et al., 2015). The Bachelor of Education program is purposefully designed around the centrality of child study; a key part of professional learning is seen as having a sound understanding of child development, “how children, learn, change and develop over time” (Gravett et al., 2019: 3). The aim is to develop strong professional practice knowledge through an inquiry-orientation within a school placement.

Democratic professionalism

A further typology is deliberately aimed at building inclusive spaces for the active participation of non-dominant families and communities in teacher education, including in the conceptualization of the program. The cornerstones of such partnerships are respect for community knowledge and a mutually beneficial interaction of teacher educators, families, and communities:

[this is] a form of democratic professionalism ... where current power hierarchies are reduced and where teachers, teacher unions, and teacher educators work in more genuinely collaborative ways with families and communities in schools, in the programs that educate teachers, and in communities
 Zeichner (2019: 5).

An example of such an approach are some of the urban teacher residencies (UTRs) in the United States. Teacher candidates here spend time in schools, often seeking shared responsibility for teacher education among university, school and, in certain cases, local communities. While UTRs differ in design and ideology, there are those that seek deliberately “to be more relevant and connected to problems of practice in public schools and to successfully draw on the expertise that is located in universities, schools and local communities under a new more democratic form of teacher education governance” (Zeichner, 2014: 262). The intention here is to integrate academic, practitioner, community and student knowledge, and not to privilege one over the other (Klein et al., 2016).

Another example of a partnership that works within this approach can be cited from South Africa. [Silbert \(2019\)](#) discusses a university-school partnership at the University of Cape Town that works across a strong social divide and stark socioeconomic differences between the university and the school. Reflecting on these power differentials, the project sought to move beyond normative assumptions of reciprocity and mutuality to the co-creation of spaces for the collective empowerment and solidarity of partners. In so doing, the project hoped to establish a “communicative ethic which encompasses dialogic engagement and moral humility” ([Silbert, 2019: 12](#)).

The variations in these models of partnership give rise to different expectations and structures for schools and universities. However, even within these differences, the broad purpose remains the same, namely, to provide opportunities for perspectives on teaching and learning to be shared in mutually beneficial ways across schools, universities and, in some instances, communities.

Key concepts

This section outlines some of the more prominent conceptual categories of analysis that are drawn on in the research on university-school partnerships.

Cultural historical activity theory

Much of the conceptual work on university-school partnerships draws on the framework of cultural historical activity theory (CHAT) associated with the work of Engeström (see [Ellis et al., 2010](#)). CHAT is a useful framework, as it helps to identify the spaces that need to be traversed when working across different systems, as in a university and a school, each with its respective cultures, histories, organizational arrangements, norms, etc.

Six analytic categories are associated with CHAT, namely subject, object, outcome, instruments/tools, rules, community, and division of labor ([Tsui et al., 2009: 32](#)). These categories might be differently understood and enacted within the purpose, organization and culture of universities and schools, and this may well create tensions in school-university partnerships ([Edwards et al., 2009](#)). These differences include purpose, function, structure, rules and regulations, calendars and schedules, work routines, orientation to teaching. For example, university academics and schools might share the same commitment to quality education (object), as well as similar expectations for the partnership of knowledge sharing, practical experience, and interaction with experienced teacher mentors (outcome). At the same time, however, different mediating tools might be in use (for example, lesson planning formats, time for meetings), different rules (lines of accountability), or divisions of labor (for example, responsibilities of mentors).

The extent to which these different expectations and understandings inhibit or advance dialog, cooperation and collaboration will depend on the commitment of the partners to sharing their perceptions, and to using the opportunity of working together to help explore new possibilities in their practice.

“Third space”

An oft-cited concept in the literature on university-school partnerships is that of a “third space”. The idea of a third space draws from a hybridity theory that recognizes that individuals draw on multiple discourses to make sense of the world. Third spaces reject binaries such as practitioner and academic knowledge or theory and practice and involve an integration of what are often seen as competing discourses. In this manner, the either/or perspective is transformed into a both/also point of view ([Zeichner, 2010](#)). Practitioner knowledge and academic knowledge, which are often seen as separate domains, are brought together to create new and richer learning opportunities for prospective teachers.

The notion of a “third space” is also an epistemological one; it breaks down assumptions of a hierarchy between the academic knowledge of the university and the professional knowledge of the school. Authority is seen to reside in both forms of knowledge; through an integration of these different sources of knowledge, students gain access to expanded learning opportunities.

Boundary crossing

Working across the activity systems of the school and the university is likely to require navigation across different patterns of interaction, cultures, structures, and expectations. This navigation, or “boundary-crossing”, refers to the engagement that occurs as members of the different communities (or activity systems) come together to consider matters of mutual concern.

Boundary objects are the tools or artifacts that mediate boundary crossing; an example here is lesson study, where co-planning and reflection by different participants encourages the sharing of perspectives on conceptions of teaching and learning ([Law and Tsui, 2009](#)). Processes embedded in boundary crossing include identification of the diverse practices, coordination of cooperative exchanges, reflection and expansion of perspectives, and transformation through collaboration and co-development of new practices ([Akkerman and Bakker, 2011](#)).

Expansive learning

Boundary crossing may bring to the fore competing discourse and assumptions, thereby potentially giving rise to tensions in the relationship. However, the engagement also has the potential to transform the learning experience for all parties in positive and mutually beneficial ways and to open opportunities for new learnings; crossing such boundaries “forces participants to take a fresh look at their long-standing practices and assumptions, and can be a source of deep learning” (Tsui and Law, 2007: 1290).

From this perspective, even dissonance becomes a potential source of change and innovation; “it is in the process of resolving contradictions that activity systems are transformed and expansive learning takes place” (Edwards et al., 2009: 17). Sorensen (2014) provides an example here, where he outlines how discussions between student teachers and their mentor teachers around the positioning of desks led to deeper considerations of classroom strategies, as well as of policies and practices to support teaching and learning within the school.

Horizontal expertise

Engagement and negotiation around boundary objects in a partnership requires that teachers and teacher educators bring their different forms of expertise together. As the resources of the different settings combine into new hybrid solutions, the work of the teachers and teacher educators is enriched and expanded:

Co-creating boundary objects—rather than using existing ones—facilitates the mutual engagement, negotiations, and hybridizations that characterize and generate horizontal expertise. It is this jointly created expertise—produced through negotiating language, practices, and tools—that facilitates cross-institutional communication and collaboration

Anagnostopoulos et al. (2007: 139–140).

Situations where such horizontal expertise would come into play include, for example, the co-creation of assessment rubrics between teachers and teacher educators. The negotiation of the social language of practice, as well as the articulation of competing views, creates opportunities to enrich conversation around the purpose and form of such rubrics (Anagnostopoulos et al., 2007).

Common knowledge and relational expertise

Horizontal linkages and the distribution of expertise is enhanced when different players in a partnership appreciate what is important for the other and why, and can work productively across potential differences. Edwards (2012) identifies a set of concepts to explain how interpretations of problems and alignments of practices are mediated across professional boundaries. The key concept here is that of common knowledge: “the motives that take forward each contributing practice ... [and that] mediate interactions across practice boundaries and give strategic direction to activities in and across services which are in the process of integration” (Edwards, 2012: 22).

The building of common knowledge requires relational expertise—the ability to recognize what the other partner values, to be able to take their standpoint, and to align one’s motives in order to pursue the engagement in mutually productive ways (Edwards, 2012). In this sense, relational expertise goes beyond understanding the work of another, or simply sharing one’s specialist expertise (as might happen in a discussion about pedagogical practices between teachers and teacher educators); the emphasis rather is on the ability to work in cooperative ways toward the integration of knowledge, “recognizing what others can offer a shared enterprise and why they offer it; and being able to work with what others offer while also making visible and accessible what matters for you” (Edwards, 2012: 26).

The establishment of the Oxford Deanery (a university-school partnership in the United Kingdom) provides an example of seeking common knowledge through relational expertise. Participants in initial teacher education, continuous professional development, as well as research, were invited to jointly construct the Deanery, so that it would reflect what mattered to all involved (Fancourt et al., 2015). In this way, student teachers were not seen as “boundary crossers”, but rather as participants in a shared and mutually constructed endeavor.

Sociocultural perspectives on professional learning

A further conceptual perspective on university-school partnerships focuses more deliberately on the learning process within the partnership. Drawing on a sociocultural perspective on learning, Tsui et al. (2009) argue that teacher learning is a function of both individual cognitive processes as well as broader social processes of which the student teachers and teachers are a part. They draw on the theoretical concepts of communities of practice, legitimate peripheral participation, and identity, all of which refer to the ways in which meanings are negotiated and identities shaped as student teachers participate in the life of a school:

How participants position themselves in the social space that is created as community boundaries are crossed, how they make sense of new forms of activities that emerge from the interactions, how they appropriate the sociocultural tools that are brokered in boundary crossing and how they negotiate the meanings of the joint enterprise are critical processes which constitute the learning experience and shape their identities as teachers

Tsui et al. (2009: 42).

Examples of such processes include being invited to participate in the full repertoire of teaching (Edwards and Tsui, 2009), a three way discussion after lesson observation of a student teachers' lesson by the student teacher, mentor teacher and university lecturer (Lopez-Real et al., 2009) and collaborative inquiry of classroom teaching through lesson study (Law and Tsui, 2009).

Teacher education pedagogy

The discussion thus far has focused on the practicum, however coherence and integration across course work and clinical work are central to quality teacher education (Darling-Hammond, 2006). This means that the structure and purpose of university-school partnerships in the practicum should by rights have implications for pedagogy within the entire teacher education program. Some of these implications are outlined here.

The first implication is that program design will—to a greater or lesser extent—include networks that bring “teacher educators, disciplinary faculty, school-based leaders and teachers, teachers’ union representatives, community and/or municipality representatives, and student teachers together to exchange ideas, concerns, values, and visions” in program design, evaluation and decision-making (Cochran-Smith et al., 2020: 114).

Certain approaches to teaching and learning within the partnership are likely to be prioritized by different models of teacher education. While various models exist in the literature, we use those of Cooper and Grundroff (2017) to illustrate the point. The first model, the effective teacher, emphasizes skills, content, performativity and measurement. The model of the reflective teacher also pays attention to skills and content, but includes knowledge about learners, and consideration of the underlying values and purposes of education. The inquiring teacher emphasizes systematic enquiry, deploying research and evaluation methods and techniques, while the transformative teacher adopts a critical enquiry approach, looking beyond the classroom to consider social context, moral and ethical issues (Cooper and Grundroff, 2017). Across these approaches, different pedagogical strategies will be employed in the partnership, ranging from teachers providing models of classroom practice to shared dialogs around dilemmas of practice, to critical reflection on ethics and values, to active engagement of student teachers in the community surrounding the school.

Some examples of pedagogy-in-action are described here to further illustrate learning across the partnership. Kameniar et al. (2017) describe a task where teacher candidates participate in an oral examination that assesses their capacity to use the theoretical and research discourses of the profession when speaking about practice. Assessment here focuses on the teacher candidates’ reasoning and pedagogical choices, and their capacity for informed reflection and action.

Another well-known strategy is that of the tripartite conference, where a student teacher, mentor teacher, and university teacher conduct a three-way conversation after the presentation of a lesson by the student teacher (Lopez-Real et al., 2009). Open and genuine conversations are encouraged, with the emphasis both on supporting and critically evaluating classroom practice.

The practice turn (Reid, 2011) in teacher education “suggests that views of teacher learning that emphasize cognition at the expense of the body may ultimately be inadequate—as the tacit knowledge of teachers actually resides in the body, in the situation of practice, and in the practice of teaching itself” (Mitchell and Reid, 2017: 46). Within this approach to teacher education pedagogy, the practices of teaching are explicitly studied, and observation, reflection and enactment are brought together, so that novice teachers come to understand how teachers work in embodied ways, at the same time as they make connections to teacher knowledge and reflexivity (Mitchell and Reid, 2017).

Reid describes a process whereby “core practices of teaching are ‘deconstructed’ and modeled for students, then rehearsed and approximated by students for their peers, under the gaze of an expert professional mentor giving feedback and coaching” (2011: 306). She describes the potential of this pedagogical strategy for shared dialog and critical reflection by the various partners:

In this case too, the expert teacher mentors with whom we are working are also not in their own habituated places, so that the practice being studied is similarly estranged and becomes an object of study for them as coaches. They can reflect, theoretically and phronetically, on why one way of practice might be more desirable, more effective, and more professional, in a particular situation

Reid (2011: 307).

Darling-Hammond et al. (2017) support such an inquiry-based approach in their research that studied high-performing countries in teacher education. What they found was that in countries where the focus was on supporting students to become teacher-researchers who actively and regularly engaged in teacher research, action research and other forms of practice related inquiry during the course of their teacher education programs, the quality of teaching overall improved. Such programs would necessarily need to be situated within well-structured university-school partnerships to support the teacher-research component across both fields.

Key considerations for universities and schools

University-school programs that exist in local contexts to support reform and innovation are often sustained through individual and institutional initiative, goodwill and commitment. In contrast, “country-level, system-wide examples of teacher education supported by genuine university-school partnerships with a focus on inquiry-rich school experiences are much harder to find”

(Cochran-Smith et al., 2020: 92). By inquiry-rich, the authors of the report refer to student teacher practicum experiences that provide opportunities for students' ongoing reflection, the opportunity to raise questions and make connections between theory (university learning) and practice (school-based learning), as well as having the opportunity to collect and interpret practice-based data that informs their thinking on classroom teaching, school policy and practice.

Several structural, cultural, systemic and relational considerations influence the longer-term sustainability of partnerships. These "mediating preconditions of practice [include] cultures and discourses, social and political structures and dynamics, and material and economic conditions" (Kemmis, 2009: 33). This section outlines in more detail some of the more significant conditions as outlined in the research, bearing in mind that these may vary significantly across different countries.

Oversight and responsibility

Part of the collaborative efforts among all stakeholders involves oversight and responsibility for the partnership, in other words, who is responsible for the different aspects of how the partnership is established and managed. This can be complex, given that universities and schools are usually governed by different national or local departments, each of which has its own policies, procedures and practices. In addition, different and sometimes conflicting perspectives among stakeholders about what is important for student teachers' learning and development, may exist (Cochran-Smith et al., 2020).

A further challenge relates to the fact that most often the primary responsibility for student teacher learning is located in the university with the schools serving as the venue where students complete a requisite number of school-based days as mandated by the national policy that guides teacher education in the country. How this arrangement has been established and is enacted means that in most cases the university has primary control over how the student's field experience is organized and what is required of the student during their practicum. This places the primary oversight within the university and schools may then defer to the university rather than engaging as equal collaborative partners. It is, therefore, important that all stakeholders' roles and responsibilities are clearly articulated to ensure that each role player knows who is accountable for what, to whom, and for what purpose in order for all role players to be empowered and actively involved in the knowledge building and learning of student teachers.

Shared vision

A central aspect of university-school partnerships involves the developing of a shared vision regarding the principles that guide the purpose of the partnerships (Green et al., 2020). The establishment of a shared vision between the school and university is, however, only the starting point. The implementation of a shared vision is a complex and long-term process that should inform the teacher education program design, curriculum and pedagogy and guide what and how student teachers learn in practice within the partnership agreement (Cochran-Smith et al., 2020).

In addition, a shared understanding of the developmental progression of student teachers' learning, as well as what constitutes effective teaching is important (Jones et al., 2016). This refers to what student teachers should be learning in practice during their school experience in relation to their university studies in the teacher education program. Developing a sequence of learning that connects foundational and theoretical knowledge from the university course-work with students' school-based practicum will assist to close the theory/practice gap often experienced by student teachers and holds the potential to reject the assumption that theory and practice operate in two separate worlds (Cochran-Smith et al., 2020).

Trust

A key aspect of a successful partnership is that of trust between the various role players. This includes a sense of mutuality and reciprocity (Kruger et al., 2009) where trust is constructed through shared understanding, and where there are benefits gained for each partner. Mutuality refers to each partner understanding the conjoint outcomes that can be achieved by collaboration while reciprocity is achieved when each stakeholder recognizes and acknowledges the value and expertise that each partner brings to the partnership (Kruger et al., 2009). Thus, trust moves beyond what can be mandated by policy and involves a willingness of all role players to bring commitment and expertise to the partnership to the benefit of all involved.

Time

Issues of time for all role players can be a challenging aspect in university-school partnerships. This involves time for university and school-based educators to engage in regular discussions regarding the planning and design of student teachers' learning experiences during their practicum. Green et al. (2020) note that when working with multiple parties in partnership agreements a deeper level of engagement and discussion is involved which usually takes more time and effort than the basic conversations or correspondence that might be the norm between universities and school-based teacher mentors. To build truly collaborative university-school partnerships co-operative dialoging, and an opportunity for differences in agendas and perspectives to be shared and acknowledged, needs to take place (Cooper and Grudnoff, 2017).

Sustainability

For partnerships to be sustainable, shared governance with dedicated resources and funding that foster sustainability within the partnerships is necessary (Burns et al., 2016). By shared governance, Burns et al. (2016) refer to aspects of decision-making that develop shared routines, rituals and celebrations. Sharing governance of partnerships assists to develop genuine commitment between schools and universities which is needed to establish and build long-term relationships and partnerships that are built on mutual professional respect and trust between all participants (Cooper and Gudnoff, 2017).

Partnerships will struggle to be sustainable if they are developed only through the “determined efforts by inspired individuals” (Kruger et al., 2009: 50). Ongoing and enduring institutional support is essential for the sustainability of partnerships both at university and school level. Green et al. (2020: 418), discussing the sustainability and expansion of partnerships, note that issues of systems within institutions, changing personnel, insecurity of funding, as well as the scalability of partnerships, are all aspects which need to be taken into account.

Equal partners

Within partnership agreements, schools and school personnel often do not perceive themselves to be equal partners in the teacher education process. This may lead to schools choosing not to prioritize resources to develop or extend partnerships with universities (Cochran-Smith et al., 2020). In addition, due to the sometimes perceived uneven status of the role players in the partnerships (student teachers, university staff members and the school-based teacher mentor), tensions may develop which could hamper a genuine sharing of ideas and cooperation across universities and schools (Cohen et al., 2013). Thus, truly equal partnerships between schools and universities can be difficult to achieve as teacher knowledge and expertise is at times devalued or marginalized and university ideas and theories are often given precedence by teacher educators.

To counter power relationships Payne and Zeichner (2017) argue for “collaborative egalitarianism” that invites universities and schools to work together on student teacher practicum as an authentic problem to which both university and school personnel share expertise to solve the issues that arise. Similarly, Burns et al. (2016) argue that all stakeholders should be involved in developing university-school agreements. By all stakeholders, as per Payne and Zeichner’s concept of “collaborative egalitarianism”, Burns et al. (2016) suggest that university-school partnerships should include engagement between the school and local community where the community is conceptualized more broadly than educational practitioners within the school walls. In other words, it involves connecting and building bridges with local communities, homes, parents and so forth. Simply developing partnership agreements between universities and schools should not be seen as true collaboration unless all parties involved are given equal “voice” in how the student practicum process is established (the vision and aims of the process), unfolds, and responds to challenges that arise. When teaching practicums are developed as “collaborative egalitarianism” university academic knowledge, school-based practitioner knowledge and community knowledge are given equal status and a non-hierarchical interplay between academic, practitioner and community expertise is established (Payne and Zeichner, 2017).

Teacher mentors

While university-school partnerships involve multiple role players, the role that the teacher mentor plays has a significant impact on student teachers’ school-based experiences. Being an effective teacher mentor is not the same as being a good teacher, nor does it simply mean making classroom teaching opportunities available to students. Mentoring student teachers during their practicum involves a form of professional practice that requires the teacher mentor to draw on their knowledge of the practice of teaching to create learning opportunities with focused feedback that supports and extends a student teachers’ practice (Feiman-Nemser, 2001; Feiman-Nemser and Beasley, 2007). As such, mentoring student teachers in their school-based teaching experience has its own skills, knowledge and practices and ideally teacher mentors should be given formal systematic training which includes mentor teachers engaging in their own critical reflection on the mentoring process (Aspfors and Fransson, 2015). Thus, as suggested by Cooper and Gudnoff (2017) there should be a more rigorous process of identification, selection, training and resourcing of teacher mentors.

Acknowledgment and recognition of teacher mentors

Internationally, an ongoing concern is that teacher mentors are expected to mentor student teachers in addition to their normal teaching responsibilities often without a clear description of what their role as a teacher mentor entails or an understanding of the process involved (Cohen et al., 2013). Mentoring students requires additional preparation and time out of a teacher’s already busy day and there are rarely any formal benefits for a teacher agreeing to mentor student teachers. Within formal university-school partnership agreements, teacher mentors might also be expected to meet regularly with university staff to discuss the teaching practicum process, adding extra time, preparation and responsibility to a teacher’s already full load (Cohen et al., 2013).

A similar concern exists for university-based teacher educators with respect to the acknowledgment and recognition of the work of establishing and maintaining partnerships. Few incentives exist for faculty members to engage in the work of coordinating, mentoring and monitoring field-based placements and this work is often carried out by adjunct staff who may not be in touch with the core principles of the teacher education program (Zeichner, 2010). Communication, developing relationships and the building of

trust—all key aspects of partnerships—are hardly valued in a competitive higher education context, where academics are rewarded for generating funding and publishing in high-status journals (Ellis and McNicholl, 2015). This may be exacerbated where a separation exists between so-called academic and professional workers, either within the division of labor of the university (Gunn et al., 2020) or within the self-identities of the academics themselves (Robinson and McMillan, 2006).

Professional inquiry

Policies and mandates, while important for sustainability, are in themselves no guarantee of successful implementation of partnership agreements. Even where enabling structural arrangements like time, resources and memoranda of understanding are in place, meaningful opportunities for a theory-practice dialog will depend on the active and willing engagement and agency of the participants in such encounters. For both universities and schools, a move within a partnership to integrate theoretical knowledge, situational awareness and practical know-how (Winch et al., 2015) places responsibilities on the inquiry orientation of both parties. For universities, this means embracing an epistemology that recognizes the expertise of schools and communities as co-existing on a more equal plane with academic knowledge (Zeichner, 2010). For schools, it becomes important that “inquiry as stance” (Cochran-Smith and Lytle, 2009: 44) is part of the ethos and daily functioning of the school so that teachers are encouraged to share concerns, deliberate on dilemmas, and explore innovative practices among their colleagues, as well as with the university. Where such inquiry cultures exist, the possibilities for mutually beneficial dialogs becomes so much stronger.

Several factors influence the capacity for schools to indeed establish a culture of inquiry. At a constraining level, these factors could include heavy workloads, demanding schedules, too much administrative work, little time for collaborative engagement, poor leadership, innovation overload, or a lack of trust and collegiality (Robinson, 2009). Furthermore, Hogan (2015) has pointed out that educational reform measures that homogenize and standardize teaching, and which encourage teaching-to-the-test pose a considerable risk to pedagogical inquiry on the part of teachers.

However, as suggested by Lund and Erikson (2016), if universities and schools work toward a more co-configuring and reconfiguring of partnership agreements teacher mentors may be capacitated to see their role as not merely recipients of student teachers, but as being part of the teacher education program and practitioner inquiry, recognizing their role as teacher educators as equal but different to the university. This focus moves from a systemic structure that requires teachers to mentor student teachers during their practicum to one that emphasizes the development of ongoing school-based learning and teacher professionalism, with a focus on learning for all stakeholders (see Kruger et al., 2009). This may assist teachers to view practitioner inquiry not as an additional workload but as forming part of the co-construction and integration of knowledge and research competency that creates inquiry-rich school-based experiences and a more professionally-orientated teaching force (Cochran-Smith et al., 2020).

Concerns and caveats

University-school partnerships have been presented as a powerful way to enhance teacher, student teacher and university faculty learning. However, the partnership needs to be envisaged as more than student teachers spending time in schools; in fact, various researchers have cautioned against the assumption that spending more time in schools will lead to student teachers becoming better teachers.

Ronfeldt and Reininger (2012), for example, investigated whether lengthening student teachers’ practicum improves their preparedness, or perception of preparedness, efficacy and outcomes. The study findings suggest that the duration of the practicum program has little effect on teacher outcomes, however, what does impact on student teacher outcomes is the quality of teaching experienced by the student during the practicum experience.

Zeichner (2014) points out how shifting the location of teacher education more to schools can indeed strengthen the educative value of the preparation but can also uncritically glorify learning from experience. He argues the importance of “unpacking and analyzing the underlying commitments to particular purposes of public schooling and the meaning of teaching, learning, the teacher’s role and the process of learning to teach (2014: 264).”

Working in the United Kingdom, with its well-established history of school-based teacher education, Ellis (2010) critiques what he calls an impoverished notion of learning often embedded in arguments for more school-based work in teacher education. Experience in schools, he argues, has the potential to lead to the reproduction of routines and the development of “bureaucratic virtues” like compliance. He highlights some tensions identified within the Oxford Internship Scheme, a program with a strong base of schools working with the university. These include, for example, contradictory conceptions of knowledge and learning, and issues of relative power between university academics and teacher mentors. Ellis (2010) argues for university-school partnerships to open up potential barriers to dialog so that novice teachers are encouraged to engage with the social systems in which they find themselves, so that teacher education becomes a way of “using experience as a means to develop an idealized vision of the future” (Ellis, 2010:117).

Concluding comments

This article has outlined some of the issues identified in research on partnerships. These issues are both conceptual and practical, and include how the partners envisage the purpose of the partnership, as well as how different institutions work together. Not all

partnership models developed can be generalized. In other words, some aspects of partnerships models are site-specific due to particular institutional arrangements. However, aspects of how a partnership model has been established and operates successfully can be helpful as a sort of “template” for other partnership models to be developed in their own settings (Fancourt et al., 2015: 369).

What is clear in the international literature is that “partnerships between universities and schools are central to the success of almost all education reforms, even though establishing true partnerships is very difficult work” (Cochran-Smith et al., 2020: 90). However, at the very least, it is clear that university-school partnerships need to be founded on a sense of mutual benefit, with key elements of trust, vision, conceptions of teaching and learning and enabling structural conditions being central. Partnerships take time, effort, resources and ongoing collaboration by all involved. Unless all role players agree on the focus and intention of the partnership, partnerships may struggle to be sustained. Partnerships also need to move beyond individuals within the partnerships. Partnership agreements that are in place at a more systemic level rather than through the efforts and interests of individuals have a better chance of being sustained over time. In addition, developing the capabilities and incentives of those involved in university-school partnerships may assist to support and develop deeper levels of engagement and learning by all stakeholders over time.

Introduction

Pre-service teachers' (PSTs) central position in practice provides an "inside looking out" perspective that expands the more theoretical "third space" concept, which is increasingly used to describe less hierarchical partnerships in Teacher Education (TE). The empirical case presented here highlights PSTs' views on their practice experiences to illuminate the inner dynamics of these partnerships. PSTs' voices are essential to achieving a pragmatic understanding of how the third space works and how their perspectives contribute to forming an "inside looking out" narrative of the dynamics of becoming a teacher.

In the first part, this study discusses the notion of partnerships in TE and the concept of the third space in TE research and practice. The study then examines the possible compatibility of the third space with the theory of Communities of Practice (Lave and Wenger, 1991; Wenger, 1998), showing how they complement and enrich each other when dealing with partnerships in TE. Later, we draw from an empirical study with PSTs to present an "inside looking out" perspective that helps us understand the opportunities and challenges related to experiencing practice in the third space. Thereby, this study aims to contribute to the knowledge of how the third space operates and what elements PSTs perceive to be relevant for their learning process. By using the concept of Communities of Practice as a framework, this study also aims to expand our understanding of how partnerships can further support professional development in TE.

TE combines core elements of theoretical and practical knowledge that prospective teachers need in order to develop their teaching in the field. It is therefore crucial to ensure a strong flow between these elements. Contemporary educational research highlights partnerships as an effective and sustainable way to strengthen the connection between schools and TE institutions (Cochran-Smith and Lytle, 1999; Darling-Hammond, 2006; Allen et al., 2013a; Bloomfield and Nguyen, 2015; Lillejord and Børte, 2016; Miles et al., 2019b). Partnerships in TE are institutionally mandated networks that develop relationships based on mutual support, shared responsibility, and ambitions (Bloomfield and Nguyen, 2015) on the one hand, and encourage less hierarchical relations between partners that acknowledge practice expertise and support hybrid professionals on the other (Zeichner, 2010; Zeichner and Payne, 2013; Allen et al., 2013b; Beaton and Hope, 2022). The latter aspect has received significant attention in educational research worldwide with the aim of fostering effective partnerships that move away from vertical forms to connect and balance the dominant narratives of the two separate spaces of schools and TE institutions.

One of the main objectives of partnerships is to enhance the quality of TE and support PSTs' learning and transitioning into the teaching profession. Although partnership collaboration intends to connect schools and TE institutions, these do not necessarily result in the desired outcomes (White et al., 2010; Walsh and Backe, 2013). Hence, the following section will present key aspects of partnerships in TE and explore successful collaboration stories and challenges associated with their development.

Partnerships in teacher education

As practice is a fundamental element for teachers' professional development, partnerships need to genuinely promote collaboration to improve the quality of TE and provide meaningful practice experiences for future teachers (Darling-Hammond, 2014; Zeichner, 2010, 2012; Barragan, 2017; Broadley et al., 2019; Chan, 2019). Learning to teach requires a sound integration of theoretical knowledge and coherent and authentic experiences from practice. In response to this, educational research endorses the establishment of alliances that foster this integration (Darling-Hammond, 2010, 2017; Le Cornu, 2010, 2015).

An essential characteristic of these partnerships is the implementation of a practice that facilitates the transition into the teaching profession within an integrated learning community that disrupts boundaries across institutions (Jackson and Burch, 2019; Lemon et al., 2018; Campbell-Perry, 2022). Other researchers have found that such partnerships can be successful when the partners share goals and merge knowledge sources. For instance, Vagi et al. (2019) and Allen and Wright (2014) demonstrate how PSTs benefit from and improve their teaching quality through prolonged student residencies and embedded coursework assessments, respectively. Such joint activities provide opportunities to adapt knowledge from school classrooms to campus and vice-versa through exploration, communication, and shared experiences. This research indicates that a solid collaboration in partnerships, as organizational tools (Lillejord and Børte, 2016), can provide PSTs with access to an authentic learning experience that facilitates their development, instills confidence in their knowledge, and improves their readiness to teach.

However, research has found that partnerships do not automatically increase collaboration or guarantee successful cooperation. The traditional academic hegemony of TE institutions maintains hierarchical relationships that hinder the creation of sustainable bridges between practices at schools and TE institutions (Snow-Geron, 2005; Barak et al., 2016; Zeichner et al., 2015).

Over the last decade, educational researchers have been increasingly interested in partnership models that support the third space. The third space in this context denotes a meeting point where equal participation and status are granted to schools and TE institutions. The third space for collaboration in partnerships favors PSTs' development, as it benefits the schools and TE institutions by improving teachers' practices, pupils' performance, teacher retention rates, and cooperation (Darling-Hammond, 2010; Zeichner, 2012; Allen et al., 2013b). As Barak et al. (2016, p. 38) argue, "For partnerships to flourish, the existing institutional borders have to become penetrable to enable interactions among the practice and discourse in the different institutions." Hence, the third space has become an alternative model of collaboration between schools and TE institutions that promises an epistemic change and a new way to enact practice.

Partnerships in the third space

In essence, the third space is used to examine the areas "in-between" and the hybridity of two or more discourses or binaries (Bhabha, 1994). This postcolonial concept has been adopted in various disciplines and with different purposes. American scholar Kenneth Zeichner introduced the third space concept to TE discourse in 2010. In the TE field, partnerships in the third space seek to interconnect complementary learning experiences from theory and practice by developing a common language about the ways of being and becoming a teacher, blurring boundaries and favoring merging ideas, discourses, and epistemologies between schools and TE institutions (Zeichner, 2010; Ramsaroop and Gravett, 2017; Beck, 2018). In particular, partnerships in the third space can potentially sustain less hierarchical relationships among partners. Such characteristics benefit PSTs' learning processes and professional development, and disrupt the way we think about practice (Elsden-Clifton and Jordan, 2016, 2019; Klein et al., 2013, 2016; Cuenca et al., 2011; Daza et al., 2021; Buckreis, 2012).

The third space can help PSTs see connections, grasp contradictions, and form a third understanding of the teaching activity, intersecting theoretical and practical epistemologies (Zeichner, 2010). It thus assigns the responsibility of preparing teachers to both schools and TE institutions, referred to here as School-Based Teacher Educators (SBTEs) and University-Based Teacher Educators (UBTEs). SBTEs and UBTEs are hybrid teachers who are tasked with the mediating role of merging practice and theory knowledge and enacting brokering work across them. From a third space perspective, the learning activities in TE that are developed on campus and in school classrooms (i.e., coursework, assessment, instruction, courses taught on-site in schools, practice, and so on) should seek to integrate epistemologies, cross boundaries, open up communication, navigate tensions, and aim to achieve greater coherence (Elsden-Clifton and Jordan, 2019; Daza et al., 2021).

Daza et al. (2021) found that the negotiation of identities through boundary-crossing and hybridity work are essential features of partnerships in the third space. Hence, boundary brokers, hybrid teacher educators, and hybrid PSTs are essential members of partnerships in the third space where they enact their roles as teachers, students, and equal partners. Such partnerships also allow for new pedagogical possibilities to emerge and invigorate practice by co-creating activities that enrich each other in productive ways (Steele, 2017; Beck, 2018; Lee, 2018; Chan, 2020), furthering the idea of "working together rather than working with" (Jackson and Burch, 2016, p. 522).

However, the utopian nature of the third space brings about challenges for partnerships in TE as well, such as adapting to new roles and identities, managing power relations among partners, and sustaining the quality of collaboration (Martin et al., 2011; McDonough, 2014; Daza et al., 2021). Hence, a constant negotiation of tensions and process evaluation are crucial factors in developing and maintaining effective collaboration between schools and TE institutions. Despite these challenges, however, educational research continues to explore the promising third space concept in order to facilitate unique opportunities to rethink and reconfigure TE.

One way to understand the nature of partnerships in the third space is to acknowledge them as complex networks of ways of knowing and doing in TE. From this perspective, schools and TE institutions are two separate communities of practice that interweave their experiences and knowledge to achieve the common goal of an integrated practice for PSTs. Therefore, the concepts of Situated Learning and Communities of Practice (Lave and Wenger, 1991; Wenger, 1998) are used here as frameworks to help us understand the role of practice in communities and the gradual process of acquiring mastery and becoming active community members.

Communities of practice: a third space perspective

The concept of communities of practice developed by Lave and Wenger (1991) and Wenger (1998) is at the core of situated approaches to learning, and it has been adopted across numerous disciplines, such as management, social sciences, and educational sciences, among others (Barton and Tusting, 2005; Lea, 2005). Lave and Wenger view participation in a community as a crucial aspect of human interaction, where identities form through mutual engagement and shared practice in social learning systems that aim to develop members' skills and exchange knowledge. Thereby, they are "groups of people informally bound together by shared expertise and passion for a joint enterprise" (Wenger, 2000, p. 139).

We propose that the concept of communities of practice can be understood, within the context of third space partnerships in TE, as a blended social learning system that integrates practical and theoretical expertise from schools and TE institutions. What makes third space partnerships "blended" is the inherently dynamic nature of TE and the "back and forth" exchange of expertise across the two separate yet interlinked communities of schools and academia. Consequently, PSTs become part of this blended community of practice, wherein they conduct practice; share a common goal; have a shared repertoire of languages, norms, and artifacts; actively choose to participate; and mutually engage in building new knowledge.

Lave and Wenger (1991) suggest the concept of "legitimate peripheral participation" to describe the situatedness of learning and the first step that takes the apprentice from the edge of practice toward the center of the activity in determined communities of practice. This peripheral zone facilitates the integration of newcomers into the mainstream in an environment that is both more tolerant to inside and outside influences and less hostile to learning and adapting to the practices in the community.

The authors describe several communities of practice (i.e., midwives, tailors, alcoholics) where newcomers take steps from peripheral participation to gradually acquiring mastery. In this process, newcomers collaborate with more experienced peers—old-timers—and participation goes beyond mere observation. It also involves doing and participating as a way of learning by "both absorbing and being absorbed in the culture of practice" (Lave and Wenger, 1991, p. 95). We believe that the concept of communities of practice that comprise peripheries in the process of "becoming" is helpful for understanding third space partnerships in TE. However, we suggest a broader approach encompassing the constant evolution of the teaching profession and the dialectics of the two communities of practice working together in third space partnerships.

The dynamics of partnerships in TE are complex and frequently pose challenges due to its transdisciplinary nature, making up intricate contexts within which PSTs gradually integrate their professional development to become in-service teachers. Wenger and Lave's more unambiguous communities of practice thus do not sufficiently capture the dynamics of third space partnerships. The factors that characterize communities of practice from a third space perspective call for a broader approach to discern the complexities of a hybrid, egalitarian community that works together but which are communities of practice in their own right.

Several essential aspects of communities of practice have implications for third space partnerships in TE. First, when PSTs and teacher educators work together in practice, they negotiate meaning as they further develop their identity. Wenger (2010) proposes that learning in communities of practice transcends new skills and building understanding and involves active participation, negotiation, and the transformation of identities. It also involves "becoming a certain person—a knower in a context where what it means to know is negotiated" (p. 2). For instance, when PSTs commute within and across third space partnerships, they "become" hybrid learners and teachers. They begin to identify and negotiate their roles, increasingly "becoming" more knowledgeable teachers and members of the teaching community.

As the negotiation of meaning and participation are central and continuous processes involved in communities of practice, we will further expand on them. For Wenger (1998), "participation refers to a process of taking part and also to the relations with others that reflect this process. It suggests both action and connection" (p. 55). Both ideas of negotiation of meaning and participation are at the heart of Wenger's communities of practice. They are used here as a framework to understand partnerships in the third space:

- (1) Negotiation of meaning: partnerships in the third space constantly face tensions due to clashes of power, disagreements on how to approach or enact practice, and the need to adapt to new roles. Such challenges are part of the hybrid work that partners develop in practice and are meant to be managed, navigated, and constantly revised. The sustainability of partnerships depends on the negotiation of meanings and the partners' will to maintain meaningful learning experiences to improve collaboration with and respect toward different knowledge and expertise. Such negotiations occur through the interplay of lived experiences that take form and become organized while participating in the community of practice. Therefore, participation is a crucial ongoing process involving personal memberships and community involvement (Wenger, 1998).
- (2) Participation is the crucial element that weaves the community together through collaborative practice. To think about participation includes thinking of peoples' "doings" and how these fit into the doings of groups and communities (Keating, 2005). From this point of view, participation creates a learning environment where common understandings emerge from the

inside and the outside, shaping a hybrid form of collaboration that integrates theoretical and practical knowledge in third space partnerships. Hence, expertise is not uniquely limited to the teacher educators as old-timers but is possessed by all members involved in the community of practice. Less hierarchical participation in third space partnerships presupposes a more hybrid and collaborative peripheral zone where PSTs and teacher educators participate and further legitimize their membership.

However, as noted earlier, this participation in the third space comes with various tensions and challenges. As a group of partners mutually participate to negotiate meaning together through some endeavor over time, they need to develop a common understanding and adopt processes and constructs for participation as shared practices. In this way, both participation and negotiation of meaning are fundamental processes by which communities of practice form. These two criteria for communities of practice are fundamental in third space partnerships. Therefore, the aim is to continuously work together toward achieving effective collaboration and sustainability rather than arriving at the metaphorical third space “podium.”

Inside looking out: PSTs' voices and experiences

The present study highlights the voices and experiences of a group of PSTs regarding practice. The overarching aim is to approach the inner workings of third space partnerships from PSTs' perspectives and understand how they integrate their practice experiences into their development as teachers. It also considers how aspects of participation, negotiation of meaning, and collaboration are crucial factors related to the enculturation process that PSTs find relevant in third space partnerships. Therefore, our research question is twofold: *How do pre-service teachers perceive practice, and how do they integrate their practice experiences into their professional development?*

Methodology

Since we aim to explore a complex social phenomenon from PSTs' perspectives, we selected the case study as a suitable research design (Cohen et al., 2018; Yin, 2014). The focus of the study are two cohorts of PSTs attending a TE program at the University of Oslo, Norway. The participants were enrolled in the Practical Pedagogical Education Program, a profession-oriented and experience-based TE program that qualifies teachers to work in upper primary and secondary schools, as well as in adult education. All participants hold a master's degree in their disciplines. The program's curriculum offers teaching qualifications and competence in subject didactics and pedagogy. This enables PSTs to plan, implement, and critically analyze teaching based on reflections from classroom experience. The program offers two alternatives: full-time study (1 year) and part-time study (1.5 years) and grants 60 European Credit Transfer and Accumulation System (ECTS) credits upon completion. During the program, PSTs are required to complete 12 weeks of professional practice.

Sample and data collection

All of the PSTs in the 2020–2021 cohort were invited to participate in an online survey regarding their perceptions of practice. The survey was conducted in two phases: before and after practice. This intended to capture as much information as possible from PSTs' experiences and perceptions. The data collection was conducted in fall 2020 and spring 2021. At the time, all the participants had experienced a practice placement at least once and were halfway through their TE program. Ethical approval for data collection was received in advance from the Norwegian Center for Research Data.

The online surveys served as a starting point to capture the general picture of PSTs' perceptions about and experiences with practice. The surveys included open-ended questions and four-point Likert scale questions. The multiple-choice questions served to gain insight into PSTs' perceptions on crucial aspects of practice and encouraged them to choose a standpoint (Clason and Dormody, 1994). The open-ended questions, on the other hand, were designed to explore their perceptions using their own words and ideas.

In line with an explorative approach (Kvale, 2007), we prepared a semi-structured interview guide based on the survey answers. The objective was to ask general follow-up questions, requiring participants to further reflect on their responses, address possible contradictions, speak up, and provide an “inside looking out” perspective of practice in the third space. Therefore, the semi-structured interviews are the backbone of the data corpus, and the surveys serve to provide general background information. All PSTs consented to participate in the study, and complete anonymity was guaranteed. In total, 184 surveys were answered before and after practice. As the surveys were anonymous, it is impossible to say how many answered prior and after. Thus, there are 184 unique answers, but the overlap is unknown. 28 PSTs participated in the interview conducted after practice using the cloud-based video conferencing system Zoom, and each lasted an average of 60 min. For an overview, see Table 1.

Table 1 Overview of data collection.

<i>Method-data tool</i>	<i>Participants</i>	<i>Quantity</i>	<i>Interview length</i>	<i>Total</i>
Surveys	Part-time cohort	77		184
Surveys	Full-time cohort	107		
Interview	Part-time	14	13 h 28 min	28
Interview	Full-time	14	14 h 12 min	

Data analysis

In the first phase of data analysis, the SPSS software was used to distribute and generate descriptive statistics of the Likert scale questions. The open-ended questions were categorically analyzed and used to assign abstract codes to ideas, phrases, and significant words. This initial approximation of the data analysis aimed to provide a general understanding of PSTs' lived experiences of practice and their perceptions about their learning process in the TE program. This first survey analysis helped to design the interview guide (Patton, 2015). All participants who completed the surveys were invited to participate in an individual follow-up interview, which was semi-structured to facilitate the free expression of participants' thoughts (Cohen et al., 2018). Twenty-eight PSTs agreed to participate in the interview and consented to their responses being audio-recorded. Notes taken during interviews were anonymized and included keywords, ideas, and verbatim quotes.

A research assistant transcribed the interview data. An inductive approach was then taken to code the transcripts and identify categories related to participants' practice experiences. The initial process included a vertical analysis (Miles et al., 2019a) where each interview transcript was analyzed separately and both NVivo and abstract codes were assigned to significant ideas and phrases. The second process involved comparing and contrasting the data to develop broad categories and identify relevant themes in and between transcripts (Coffey and Atkinson, 1996). Finally, the analysis involved identifying similarities between the themes generated by the two data sets (interviews and surveys). Then, the whole data set was scanned once more to ensure that all commonalities and relationships across themes were included. Pseudonyms are used throughout the reporting of results.

Findings

Descriptive overview

Participants undoubtedly find that practice is a crucial component of their TE. In fact, for most of the respondents, practice is the space where they can "apply" what they have learned on campus and take a closer look into the teaching profession. From all participants in the survey, 77 indicated having had a good experience with practice, which directly relates to the perception of 95 participants who marked that good communication and collaboration with the SBTEs had a significant impact on their positive perception of practice.

Feeling prepared to conduct practice professionally, emotionally, and practically was crucial in determining the outcomes of participants' practice experiences. Almost half of the participants responded that they felt underprepared. However, there was a significant difference between their readiness perceptions from the first practice experience and the second one. One of the reasons for this was that having conducted one practice boosted their confidence, as they now knew how it could unfold. For others, the challenges to be ready for practice were more linked to frustration and issues connected to the particular circumstances of conducting practice in the midst of the COVID-19 pandemic. This finding highlights how PSTs' psychological well-being is essential to their learning process.

Regarding the integration of knowledge sources, the data shows that 29 participants could interconnect expertise from practice and theory to a large degree and 51 to some degree. On the other hand, 18 participants noted that they could only do so to a small degree and found what they learned on campus to be of little relevance to what they ended up doing in practice. This was further explored in the interviews in relation to the challenges participants faced in practice.

Voices and experiences

Four major themes were generated from the data analysis: epistemic negotiations, relational factors, identity development, and opportunities and challenges. These themes are composed of several sub-themes that reflect how PSTs perceive practice and integrate it into their professional development (see Fig. 1). Fig. 1 shows, at the center and in constant movement, the third space dynamism where all community members relate to each other and engage in continuous participation and negotiation of meaning. The boundaries of the four themes are blurry and often overlap. Hence, though the themes are presented separately for the sake of clarity, some aspects within one will be relevant to and intertwined with the others. This is why the opportunities and challenges theme is presented as an integrated part of the other themes.

Epistemic negotiations

Epistemic negotiations represent a fundamental factor in participants' practice experiences. The findings indicate that participants highly value practice as an opportunity to integrate knowledge in a school setting. These negotiations occur both at the individual and at the community levels. At the individual level, participants attempt to draw connections between theoretical and practical expertise based on their own experience. However, the negotiations gain greater relevance when the participants observe, discuss, compare, and collaborate with other members of the partnership. Epistemic negotiations are closely associated with the themes of relational factors and identity development. However, the focus here is on the opportunities and challenges participants face when interconnecting knowledge sources.

Fig. 1 Inside looking out. The third space partnership as a community of practice.

Interconnections, feedback, and other blending opportunities

The findings show that learning by observing and doing bolsters the interconnection between theoretical and practical expertise. Some participants initiated their practice by observing the SBTE teach lessons before trying on their own. The participants argue that such activities provide them with tools to weave theory and practice together, improve their confidence, and reduce the initial pressure of conducting a whole teaching lesson on their own. Noah explains this in the following excerpt:

It was also very useful to have practice. Because then you can see the connection between the theoretical knowledge you have from the university and how to relate it into practice and use it at school; everything makes more sense ... We could experience before our own eyes how it is done in practice ... We had conversations to summarize and discuss what we had seen. So, in a way, this was a feedback session where we discussed our observations in light of the theory.

Participants also report that feedback sessions and conversations that connected knowledge sources and emphasized concrete aspects, such as relationship-building, motivation, and classroom management, often occurred before and after teaching pupils. The PSTs had a shared meeting with their practice peer and the SBTE where they focused on identifying the positive outcomes of the teaching session as well as possibilities for improvement. On some occasions, participants expressed that they could discuss relevant pressing issues from pedagogy or didactics. For instance, Noah, his practice peer, and the SBTE dedicated a few of the discussion sessions to work on adapted education and planned activities that could be implemented with pupils. Noah's practice experience resonates with the idea of weaving expertise by observing and doing, which can occur at different stages of the TE process at schools and on campus.

However, these opportunities are curtailed when the partners do not engage in discussions that highlight both the theoretical and practical aspects of teaching and are not receptive of the vital role they play in their professional development. The participants who emphasize observations, feedback, and discussion report that some of the teacher educators have been educated in supervision, which could suggest that they are cognizant of their roles as teacher educators. This is not to say that teacher educators without supervision education do not provide connecting opportunities to PSTs. Instead, it highlights the relevance of observations,

feedback, and collaboration in PSTs' professional development. After a challenging first practice period, Emma draws on interesting ideas regarding the implications for her professional development:

For me, practice is learning, it is a connection opportunity. I felt a bit like a "fish on land" in the first practice. I stood there [*in the classroom*] and asked myself: "How do I do this? How to deal with discipline?" We did not have a model to observe first ... I was lucky with my supervisors the second time; they talked to us, they showed us how [*to do it*]. Theory and practice seemed much more connected. I should say that practice is a very safe environment to test oneself and share information with other knowledgeable [*people*] before trying it out as a new teacher on my own.

Blending opportunities occur when "doing" as well. Beyond observations, Olivia notes that conducting the teaching lessons herself, with the support of the SBTE and practice peers, enriched her experiences and allowed her to enact her role as teacher and become increasingly confident in her pedagogical and didactical knowledge. Olivia states:

I got to practice a lot as the teacher. I developed a slightly different relationship with the pupils. The supervisor sat in the back of the classroom, and if there were any inquiries to the supervisor, he would say: "I'm not the one who has this class." So I knew I was *the teacher* and that I had his support in case something went wrong. I think it was very rewarding to try out my ideas in a safe environment. I now have a different perspective on what it means to teach a class.

Other opportunities that foster interconnections are the microteaching sessions and the authentic cases or examples that SBTEs and UBTEs use in lectures, seminars, feedback, and assessments. In the microteaching sessions, PSTs plan and conduct a teaching segment of 6–8 min to a small group of PSTs and a session leader. The session leader can be either a UBTE or SBTE. Participants find that the microteaching sessions allow them both to try out the teacher role in a safe environment before going to practice, and also serve as their first opportunity to put some of the theoretical concepts they learned into action and then discuss these with others in the community.

On negotiations

As we have explored so far, negotiations occur at schools and on campus in dynamic relationships with teacher educators, peers, pupils, and other members of the partnership community. Recognizing the different approaches to teaching appears to be essential for participants' practice experiences. For instance, Martha illustrates an explicit epistemic negotiation with the SBTE that blends with challenges and power tensions, and showcases how participants negotiate meaning:

He [*The SBTE*] talked about a bit of his experience and why he did things the way he did. Among others, he had moved away from talking about curriculum goals and such in class. He instead had "today's question." He had a bit of his own philosophy. And then I told him: "We have been told [*on campus*] that we should anchor the teaching to the curriculum and learning objectives." And then he said that "that does not exactly motivate the students." ... So, he rather uses "today's questions," which comprise the objectives, but the pupils are not made aware of that. And I wondered: "Should I listen to them [*UBTEs*], or should I listen to the supervisor [*SBTE*]?" But then I had to be a mentee! So I chose to follow the supervisor, but I was a little unsure if that was the right thing to do then.

In this example, Martha eloquently explains how she engaged in negotiations of meaning with her SBTE. As conflicting approaches to starting a lesson surfaced, she was left wondering which approach would be more appropriate. In the excerpt, we can see how Martha decided to follow the SBTE's approach and be a "mentee," demonstrating the power relations in TE. The negotiation of meaning that Martha carried out later in her practice included trying out both ways to initiate a lesson (i.e., "today's question" and presenting the learning goals) with her practice peer and arriving at her own conclusions on what could work best based on her experience.

James's practice experiences also illustrated epistemic negotiations in the third space. James and his practice peer wanted to try out different theoretical concepts, such as consolidation and differentiation. Although the topics and lesson goals were already established for James's classes, he engaged in negotiations with the SBTE and included activities that highlighted such concepts. When asked about why this was relevant for him, James answered that these concepts are often abstract, and he needed to put them to work in practice to be able to grasp the connections. However, James further reflects on how this critical aspect of practice is not always achievable, as one is dependent on the school's plans and the SBTE's willingness to negotiate and foster meaningful learning experiences.

Anna's negotiation in practice had to do with the lesson plan. Anna argues that the detailed lesson plan promoted in lectures, seminars, and other activities on campus was not equally underlined at the school. While planning the lessons together, Anna and the SBTE agreed on the importance of learning how to narrow down competence goals, establish learning objectives for the lessons, and bear in mind the pupils' needs. However, they decided to develop a more simplified plan that functioned just as well in fast-paced teaching work. In this negotiation, Anna's SBTE had an essential role in supporting Anna's participation and interweaving the knowledge that Anna had been acquiring on campus with the SBTEs' expertise from school classrooms.

Certainly, teacher educators' role in promoting meaningful learning experiences and extending meaning is crucial for participants' perceptions of practice. Sonia validates this with the following excerpt: "If there is a big gap between what you learn in theory and practice, that's where the teacher [teacher educator] comes in and builds that bridge. They can explain why they teach this or that way, bring 'real' cases to campus, bring the campus to school. Make those connections visible."

In general, participants perceive both the practical and theoretical elements of TE as constituents of their professional development. While some of their experiences reflect the complexity of interconnecting knowledge sources in practice, others found that certain activities at schools and on campus could potentially enhance the intersection of epistemologies in TE. Such opportunities integrate authentic cases to exemplify theoretical concepts on campus and vice versa at schools by taking advantage of the hybrid expertise of third space partnerships.

Relational factors

Communicating, collaborating, and cultivating relationships with other members of the third space partnership is a requisite for participation and managing the tensions that emerge when working together. This section will explore the opportunities and challenges related to forming relations with teacher educators at schools and on campus, practice peers, pupils, and others in practice. These relations are linked to perceptions of value, integration, feeling welcome, knowledge creation and sharing, and PSTs' psychological well-being.

Working together or working with?

The findings indicate that the most relevant relationships participants establish are with their SBTE and their practice peers. The relationships with the UBTEs are also relevant but are mentioned to a lesser degree. Based on the quality of these relations, the participants perceive the practice either as positive or negative or a composite of both, which denotes the complexity of relations and the role that power, tensions, and other challenges play in shaping PSTs' perspectives and learning opportunities.

The main factors that participants highlight are communication and feelings of inclusion, respect, trust, and constant support. Besides the SBTEs, these factors relate to the partnership as a whole (other teachers at school, UBTEs, administrative staff at both school and university). As Emma puts it, positive relations in practice mean feeling "*valued and seen as practice students, colleagues, and future teachers.*" Hence, participants perceive that when relations with SBTEs are positive, the negotiations and participation flow more naturally, enhancing learning opportunities and making room for fruitful discussions.

Frida explains how she developed a very good relationship with her SBTE and practice peer from day one:

I had a great experience with practice. They [all members at the partner school] are wonderful—everyone, from the principal to the secretary, to the other teachers, to my supervisor [SBTE] and practice peer. I felt welcomed from the beginning. The school was prepared to receive us and showed us all around. The supervisor built a very good relationship with us: excellent practice supervisor, very good support, and suggestions for teaching. I could not expect more. Everything was very good.

Frida's practice experience elucidates the vital role of relations in practice in third space partnerships. James holds a similar perception when referring to the practice peer. Working together with his SBTE and practice peer promoted a sense of collaboration and confidence: "The practice peer and I worked together a lot. In meetings with the supervisor [SBTE] and him [*my practice peer*], I got many confirmations that meant a lot to me: that this is the right way to go and that I have what it takes to be a teacher."

It appears that PSTs' psychological well-being is fundamental to their professional development. Feeling welcomed goes beyond the material logistics that facilitate teaching. It involves the integration of PSTs into the mainstream of the community in an environment that is tolerant and that supports participants' progressive learning and continued adaptation.

Another relevant factor to effectively integrating PSTs in partnerships is trust, which is related to the feeling of assurance participants experience when given more and greater responsibilities and opportunities to interact with the school community in and outside of the classroom. Jacob highlights this by stating that he was able to try out new ideas in the classroom with the SBTEs' support and interact with pupils and other teachers in various activities.

However, not all participants were as satisfied with their relations in practice. When PSTs experience a lack of communication, unwillingness to engage in discussions, unpreparedness, or any other impediment to establishing a relationship with the SBTE, the overall perception of the practice and their opportunities to integrate prior knowledge is negative. In this context, participants refer to dissonance, miscommunication, chaos, unpreparedness, and lack of guidance and report feeling "alone" in practice. Sara explains her experience with miscommunication and unpreparedness:

We [the PSTs] were told that the supervisor [SBTE], or at least the school, would contact us before practice. And it never happened. We sent an e-mail to the supervisor a few days before, and we did not get an answer. So when we got there [the school], the supervisor said, "Oh yes, it was *today* you start!" Everything in practice was a bit disorganized, Very "ad hoc," I would say.

Negative practice experiences are also often related to dissonance: the difficulties PSTs have in connecting the curriculum and the guidelines with actual implementation in practice. For some of the participants, the practice expectations were vague, as they

expressed having limited knowledge of what to observe, what to ask from SBTEs, and a general sense of confusion about the transition from theoretical conceptualizations to practice. For instance, one participant, Louise, wonders, "How many hours should the SBTE guide me? Should I try to apply the theoretical knowledge from lectures to my lesson plans? Am I allowed to suggest topics? And what if they do not fit with the school plan? What exactly will I teach?" Louise further explains that she felt like a "burden" to the SBTE, like she was in the way of his/her busy schedule. She also found scanty assistance from the campus. Louise could not engage in feedback sessions with her practice peer, as the SBTE could not do so due to time constraints, only having a few general feedback sessions.

Margarita says she felt "alone" during practice, having limited contact with her SBTE and no practice peer at all. Regarding the latter, she argues that she wished she had a partner with her in practice, expressing that she missed out on the learning opportunities of having someone to discuss and plan lessons with. Similar to Louise's example above, Margarita's SBTE could not dedicate as much time to feedback sessions or observations. Instead, Margarita was left to teach several lessons without the SBTEs' presence: "They [*the school*] say that things are different in practice than what we learn at the university and that it is not like that in reality; she [*SBTE*] trusted me, I think. She left me alone to teach several times. I felt a bit like a substitute and not a student in practice." Margarita's practice experience shows how opportunities to negotiate meaning and weave knowledge are sometimes missed due to a lack of communication and guidance. In addition, she perceived her role as one of a substitute because she was left to teach alone several times. Correspondingly, performing different and hybrid roles is equally relevant in PSTs practice experiences.

Identity development

When participating and negotiating meaning in third space partnerships, all members of the community of practice commute across blurred boundaries and perform hybrid roles. Such dynamic movements and enactments foster PSTs' identity development.

Moving back and forth

As seen in the previous sections, the roles of SBTEs, UBTEs, practice peers, and other members in the partnerships are crucial to help PSTs interweave knowledge and establish connections. In this sense, participants actively perform hybrid roles in practice, as they are at the same time learners, colleagues, teachers, and partners.

Luna's comment illuminates these movements: "Sometimes I felt like a colleague, planning the lesson together with my supervisor [*SBTE*] and my practice peer, discussing possible issues, reflecting on my teaching and how to best improve it. In a way, I was both a student and a teacher." With this, Luna highlights the relevance of good communication and collaboration in practice and places herself in a hybrid role that constructed her identity as an active member of the teaching community. Other participants, such as Martin and Olivia, express similar ideas about their hybrid roles and their constant commute between different settings and practices. Martin says, "I think I was closer to being a colleague than an apprentice. I got to be the teacher who is responsible for what happens in the classroom. It's empowering; it showed that she [*the SBTE*] trusted us [*PSTs*]. We were included in meetings, and they asked for our opinions. We were not only taken into account but also heard. Like we were teachers there [*at the school*]."

Martin's excerpt further demonstrates how roles overlap and interrelate with one another. Martin seemed to have a good relationship with his SBTE and practice peer, as they created opportunities to interconnect knowledge and collaborate. These factors are embedded in participants' movements back and forth between school and academia; as a result, they enacted hybrid roles that supported their professional development.

The extent to which PSTs feel encouraged to try out new ideas, make mistakes, and later reflect on them enhances their perceptions of achievement, stimulates connections, and integrates PSTs into the community. Conversely, as we have examined before, faulty relations and a lack of participation or negotiation negatively affect PSTs' overall perception of practice and hinder the movements between theoretical and practical knowledge. For instance, Andrea explains, "It was difficult to implement what we had read in both pedagogy and subject didactics; the framework at school was narrow, and we [*my practice peer and I*] had to work on this alone. Sometimes we felt unprepared to face key issues of practice, we had not talked about that on campus. I feel I did not deliver good work; I was not a good teacher but not a good student either. It was frustrating, so the practice became demotivating." There are several implications for Andrea's professional development in the reflection above. Andrea found it difficult to draw connections between theoretical and practical knowledge, indicating challenges in epistemic negotiations and relations. Feeling alone indicates that Andrea required guidance and more opportunities to weave together knowledge sources from both the practice school and from campus. Commuting in the third space partnership and performing hybrid roles can further challenge the integration of knowledge and the identity development of PSTs who, like Andrea, face frustration and limited opportunities to participate and negotiate.

Discussion

This study contributes to and supports the growing body of research suggesting the third space as an effective partnership model to support teachers' professional development. Although the model may present challenges regarding tensions in correspondence, implementation, relations, and resources, the emphasis on horizontal relationships promises to balance the core elements of TE, granting equal value to theoretical and practical expertise. If we genuinely want to be part of the change process and influence the coming generation of teachers, we should aspire to break the vicious circle of disconnections and hierarchies that have dominated educational discourse (Barak et al., 2016).

This study reinforces four pivotal yet practical considerations for designing third space partnerships based on the “inside looking out” perspectives and experiences of PSTs.

- (1) **Fostering epistemic negotiations:** PSTs in this study implied on numerous occasions the indisputable relevance of weaving together knowledge from schools and campus in meaningful ways. Based on such negotiations, the PSTs are able to make sense and integrate the different knowledge sources into their development as teachers. Therefore, the design of practice and collaboration should include clear guidelines that stimulate the movements and integration of knowledge back and forth between these institutions.

The design of third space partnerships should consider the benefits of observation, feedback, and discussions in professional development, as highlighted by the participants. These support PSTs' learning, improve coherence, and involve all community members in participation, negotiation, and identity development. Such dialectical opportunities should be practiced on campus and at schools to promote epistemic movements within, across, and beyond the peripheries of practice. In this way, negotiating meaning in third space partnerships is an iterative process that requires active engagement and participation (Wenger, 1998).

- (2) **Cultivating relationships:** effective participation and epistemic negotiations depend to a large extent on the relations that participants establish in third space partnerships. Cultivating collaboration and professional relations, as this study demonstrated, is key to weaving knowledge, negotiating meaning, fostering PSTs' confidence, and ensuring their psychological well-being. Relations are, however, finely balanced and are often strained or limited due to time constraints, unclear expectations, and miscommunication. Relations are the backbone of third space partnerships in a community of practice that welcomes participation and work together in the process of “becoming.” Thus, cultivating them would enable participation and negotiation among partners. For PSTs, the essential relation factors in practice involved communication and feelings of inclusion, respect, trust, and support. Therefore, third space partnerships should enrich communication channels that connect participants and create more precise agreements that cultivate relations and encourage connection.
